

STELLAR & SUB-STELLAR CNO ABUNDANCES

PALOOZA S24: 4/13/2024

David Coria, Neda Hejazi, Ian Crossfield
University of Kansas

OVERVIEW

1

CNO Snowline Chemistry

Volatile element
(C, N, O) abundances
may tell us about
where a planet
formed relative to
different snowlines.

2

Recent Measurements

We will discuss
recent exoplanet &
brown dwarf isotope
measurements from
instruments like
KPIC and JWST.

3

Future Work

Finally, we'll discuss
the progress and
prospects for
measuring CNO
isotopologues in cool
dwarf exoplanet host
stars.

BACKGROUND

Stellar Abundances: Context for Exoplanet Formation

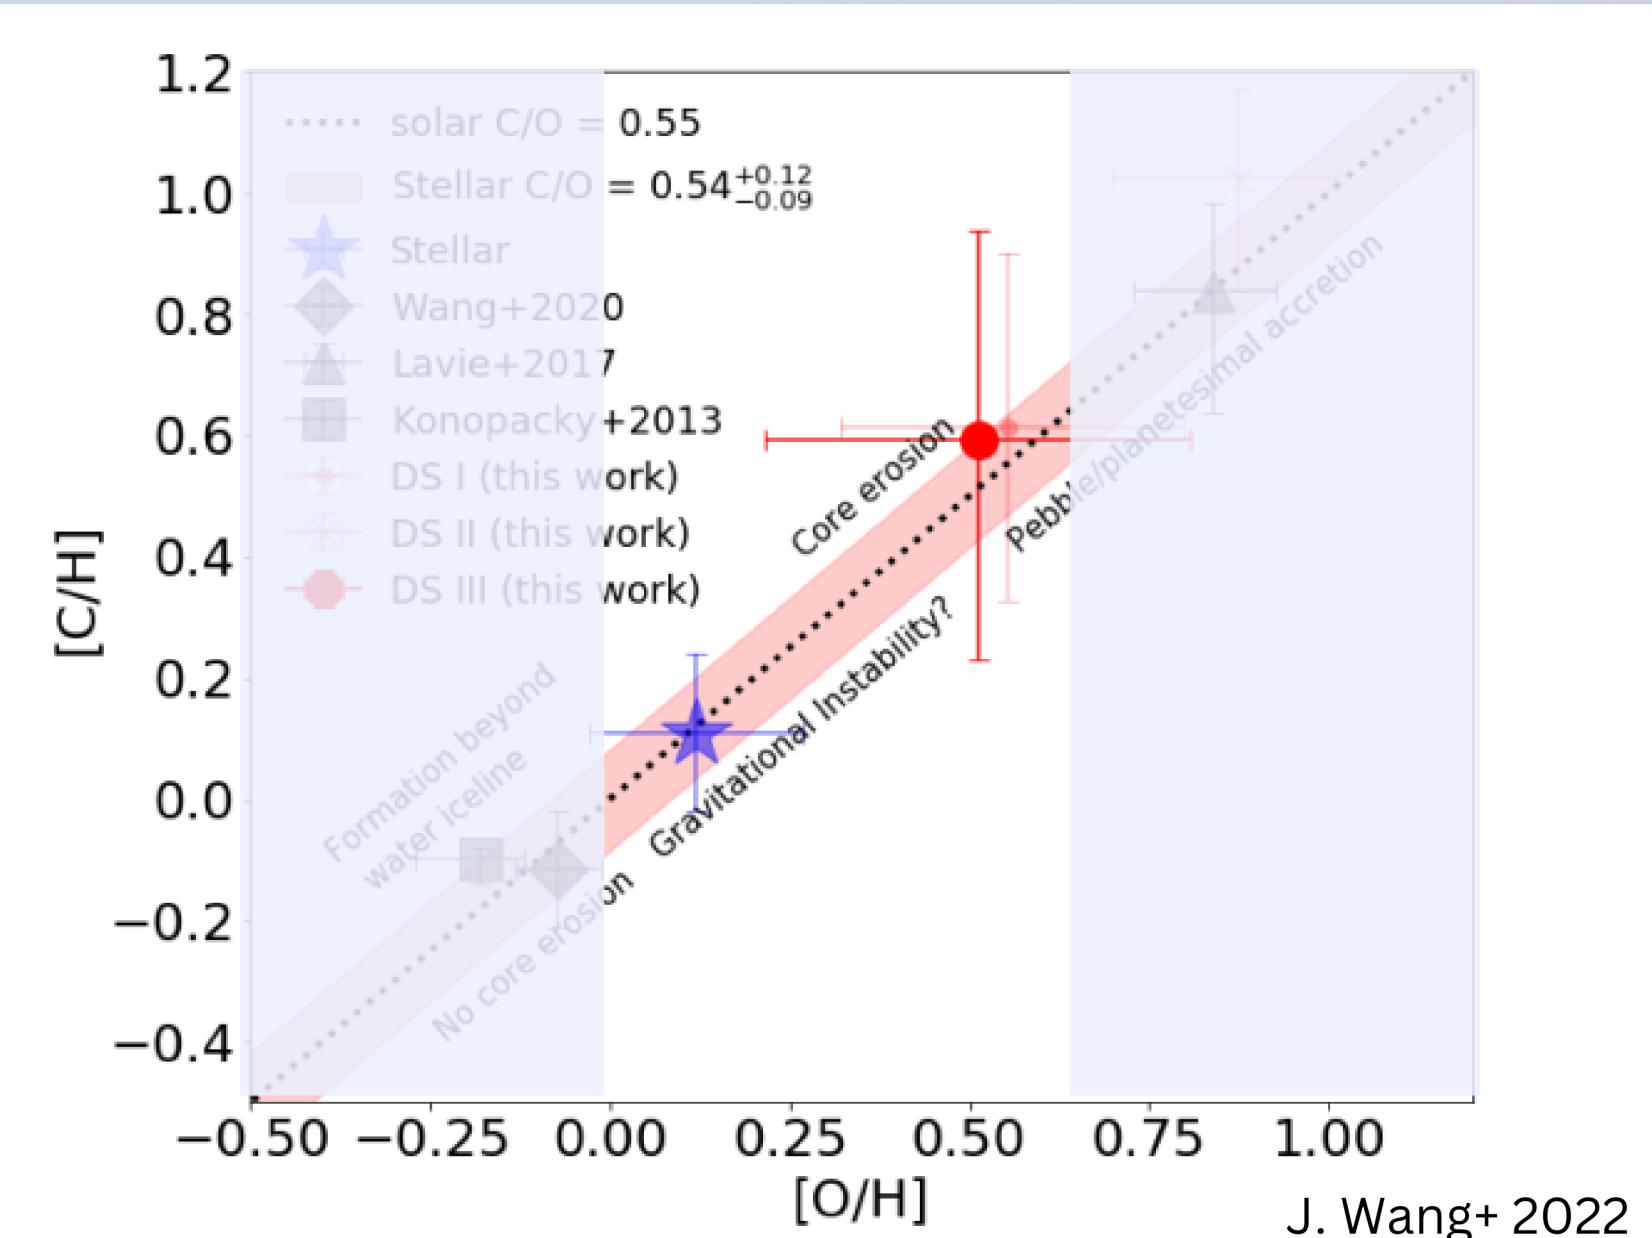

Oberg+ 2011

Abundances ~should~ trace formation location relative to snowlines

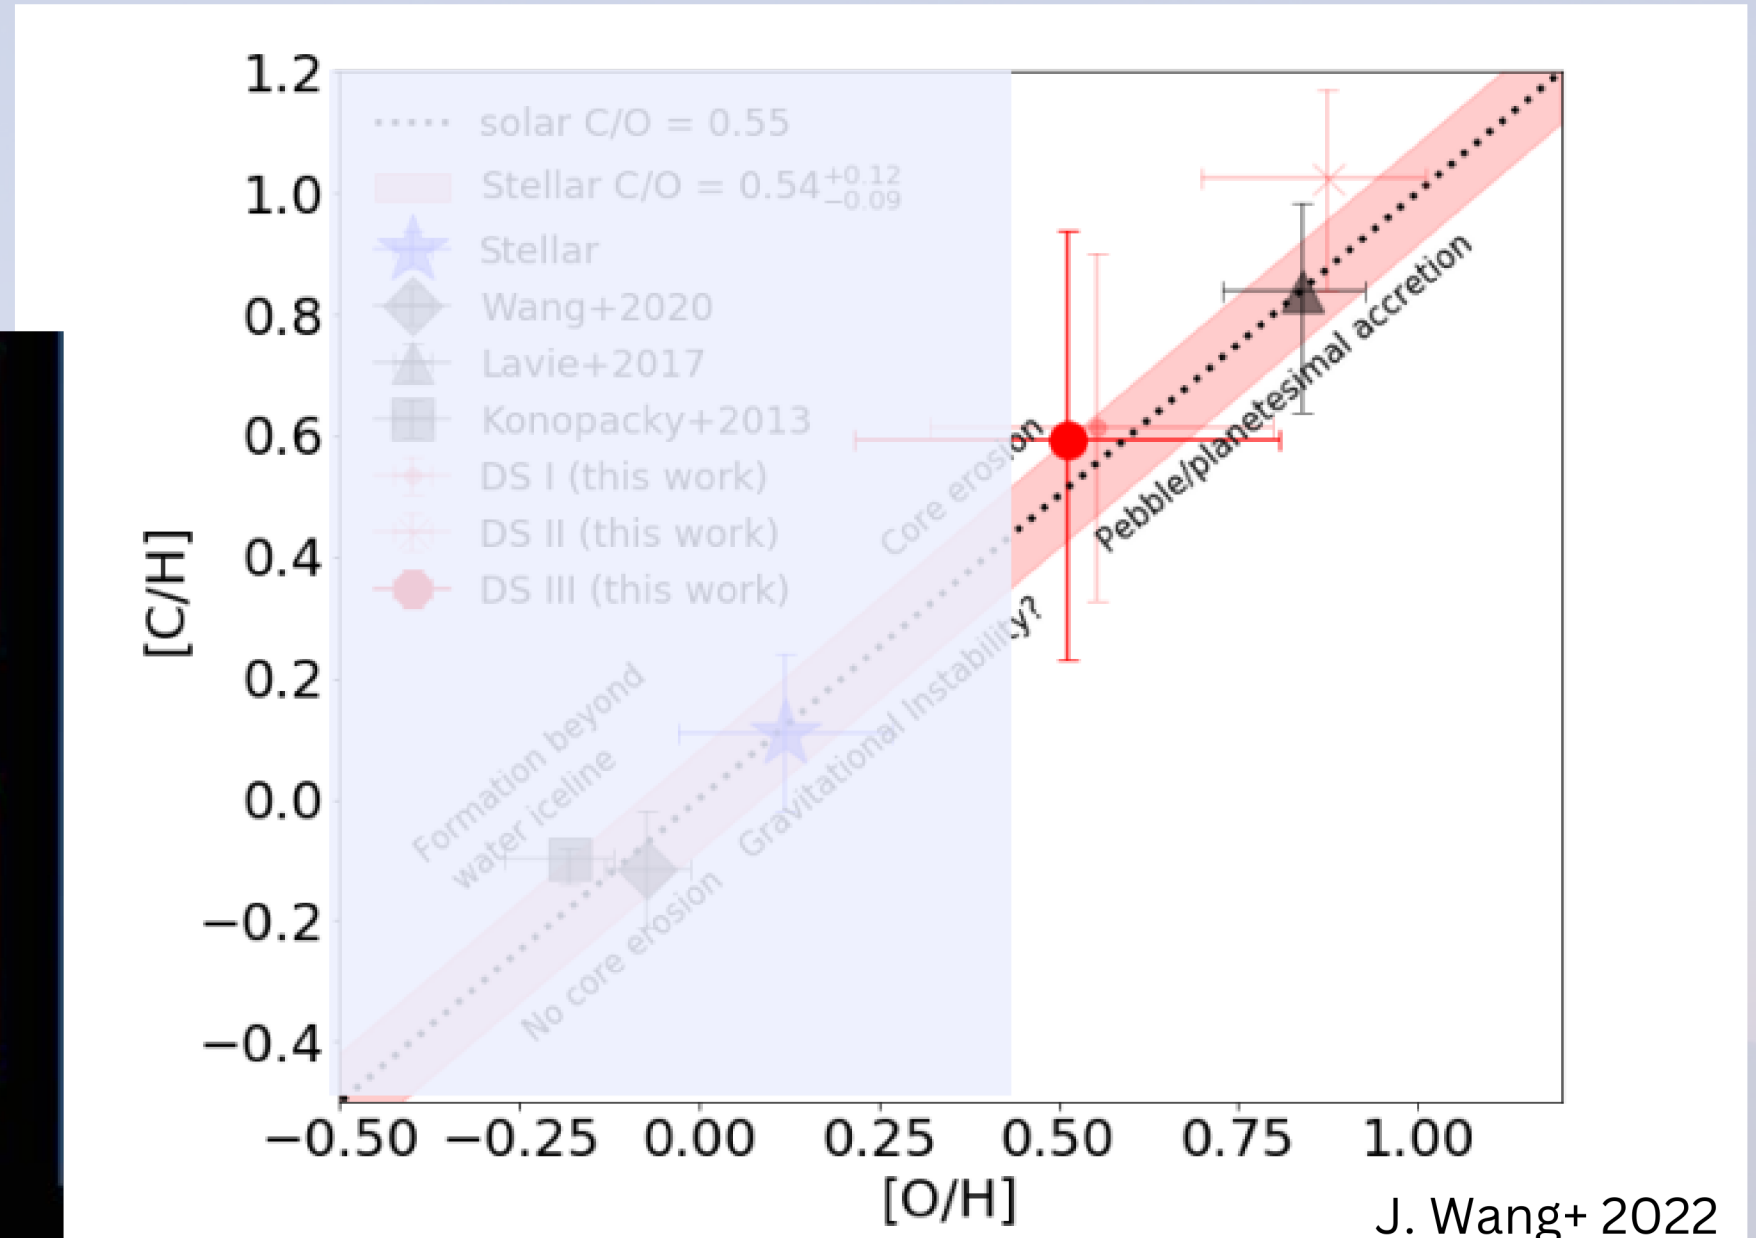

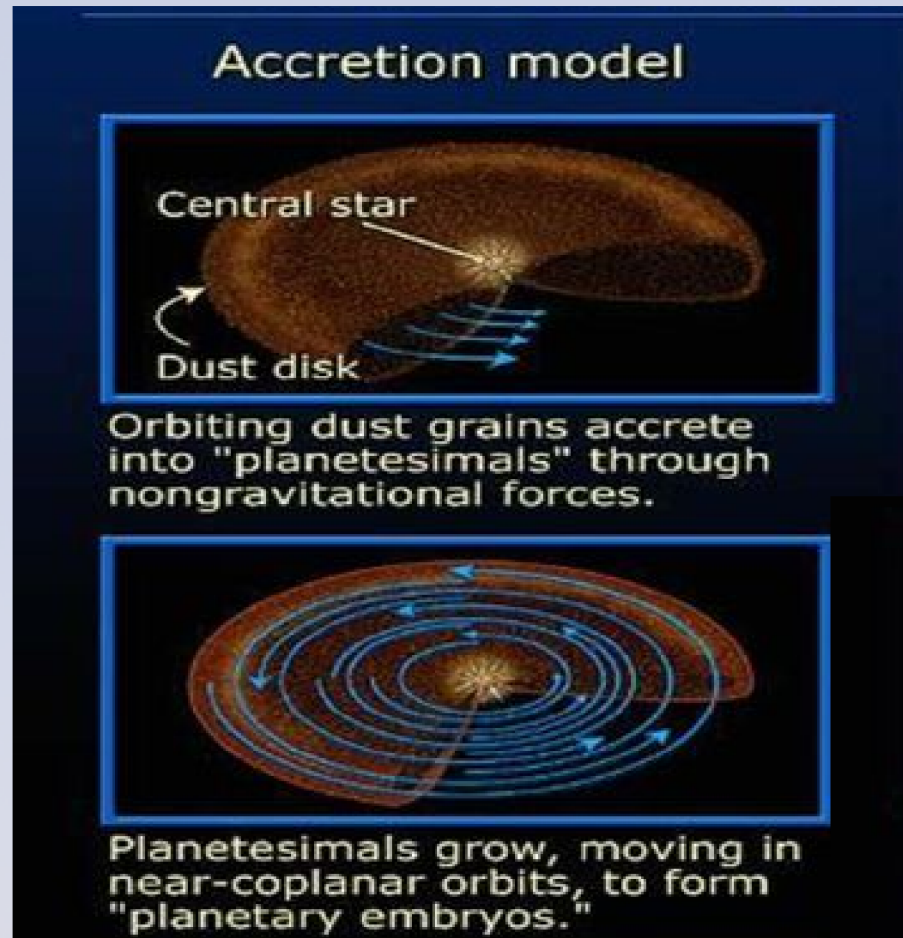

Formation via Gravitational Instability

H₂O and CO detections constrain planet formation mechanisms

Ingraham+ 2014, Barman+ 2015, Ruffio+ 2021, J. Wang+ 2022 and many others

Formation via Pebble/Planetesimal Accretion

H₂O and CO detections constrain planet formation mechanisms

Ingraham+ 2014, Barman+ 2015, Ruffio+ 2021, J. Wang+ 2022 and many others

A night sky with the Milky Way galaxy and a mountain range in the foreground. The Milky Way is visible as a bright, hazy band of light stretching across the sky, with a prominent yellowish-white core. The sky is filled with numerous stars, and a few bright, colorful nebulae are visible. The foreground shows a dark, rocky mountain range with some sparse vegetation.

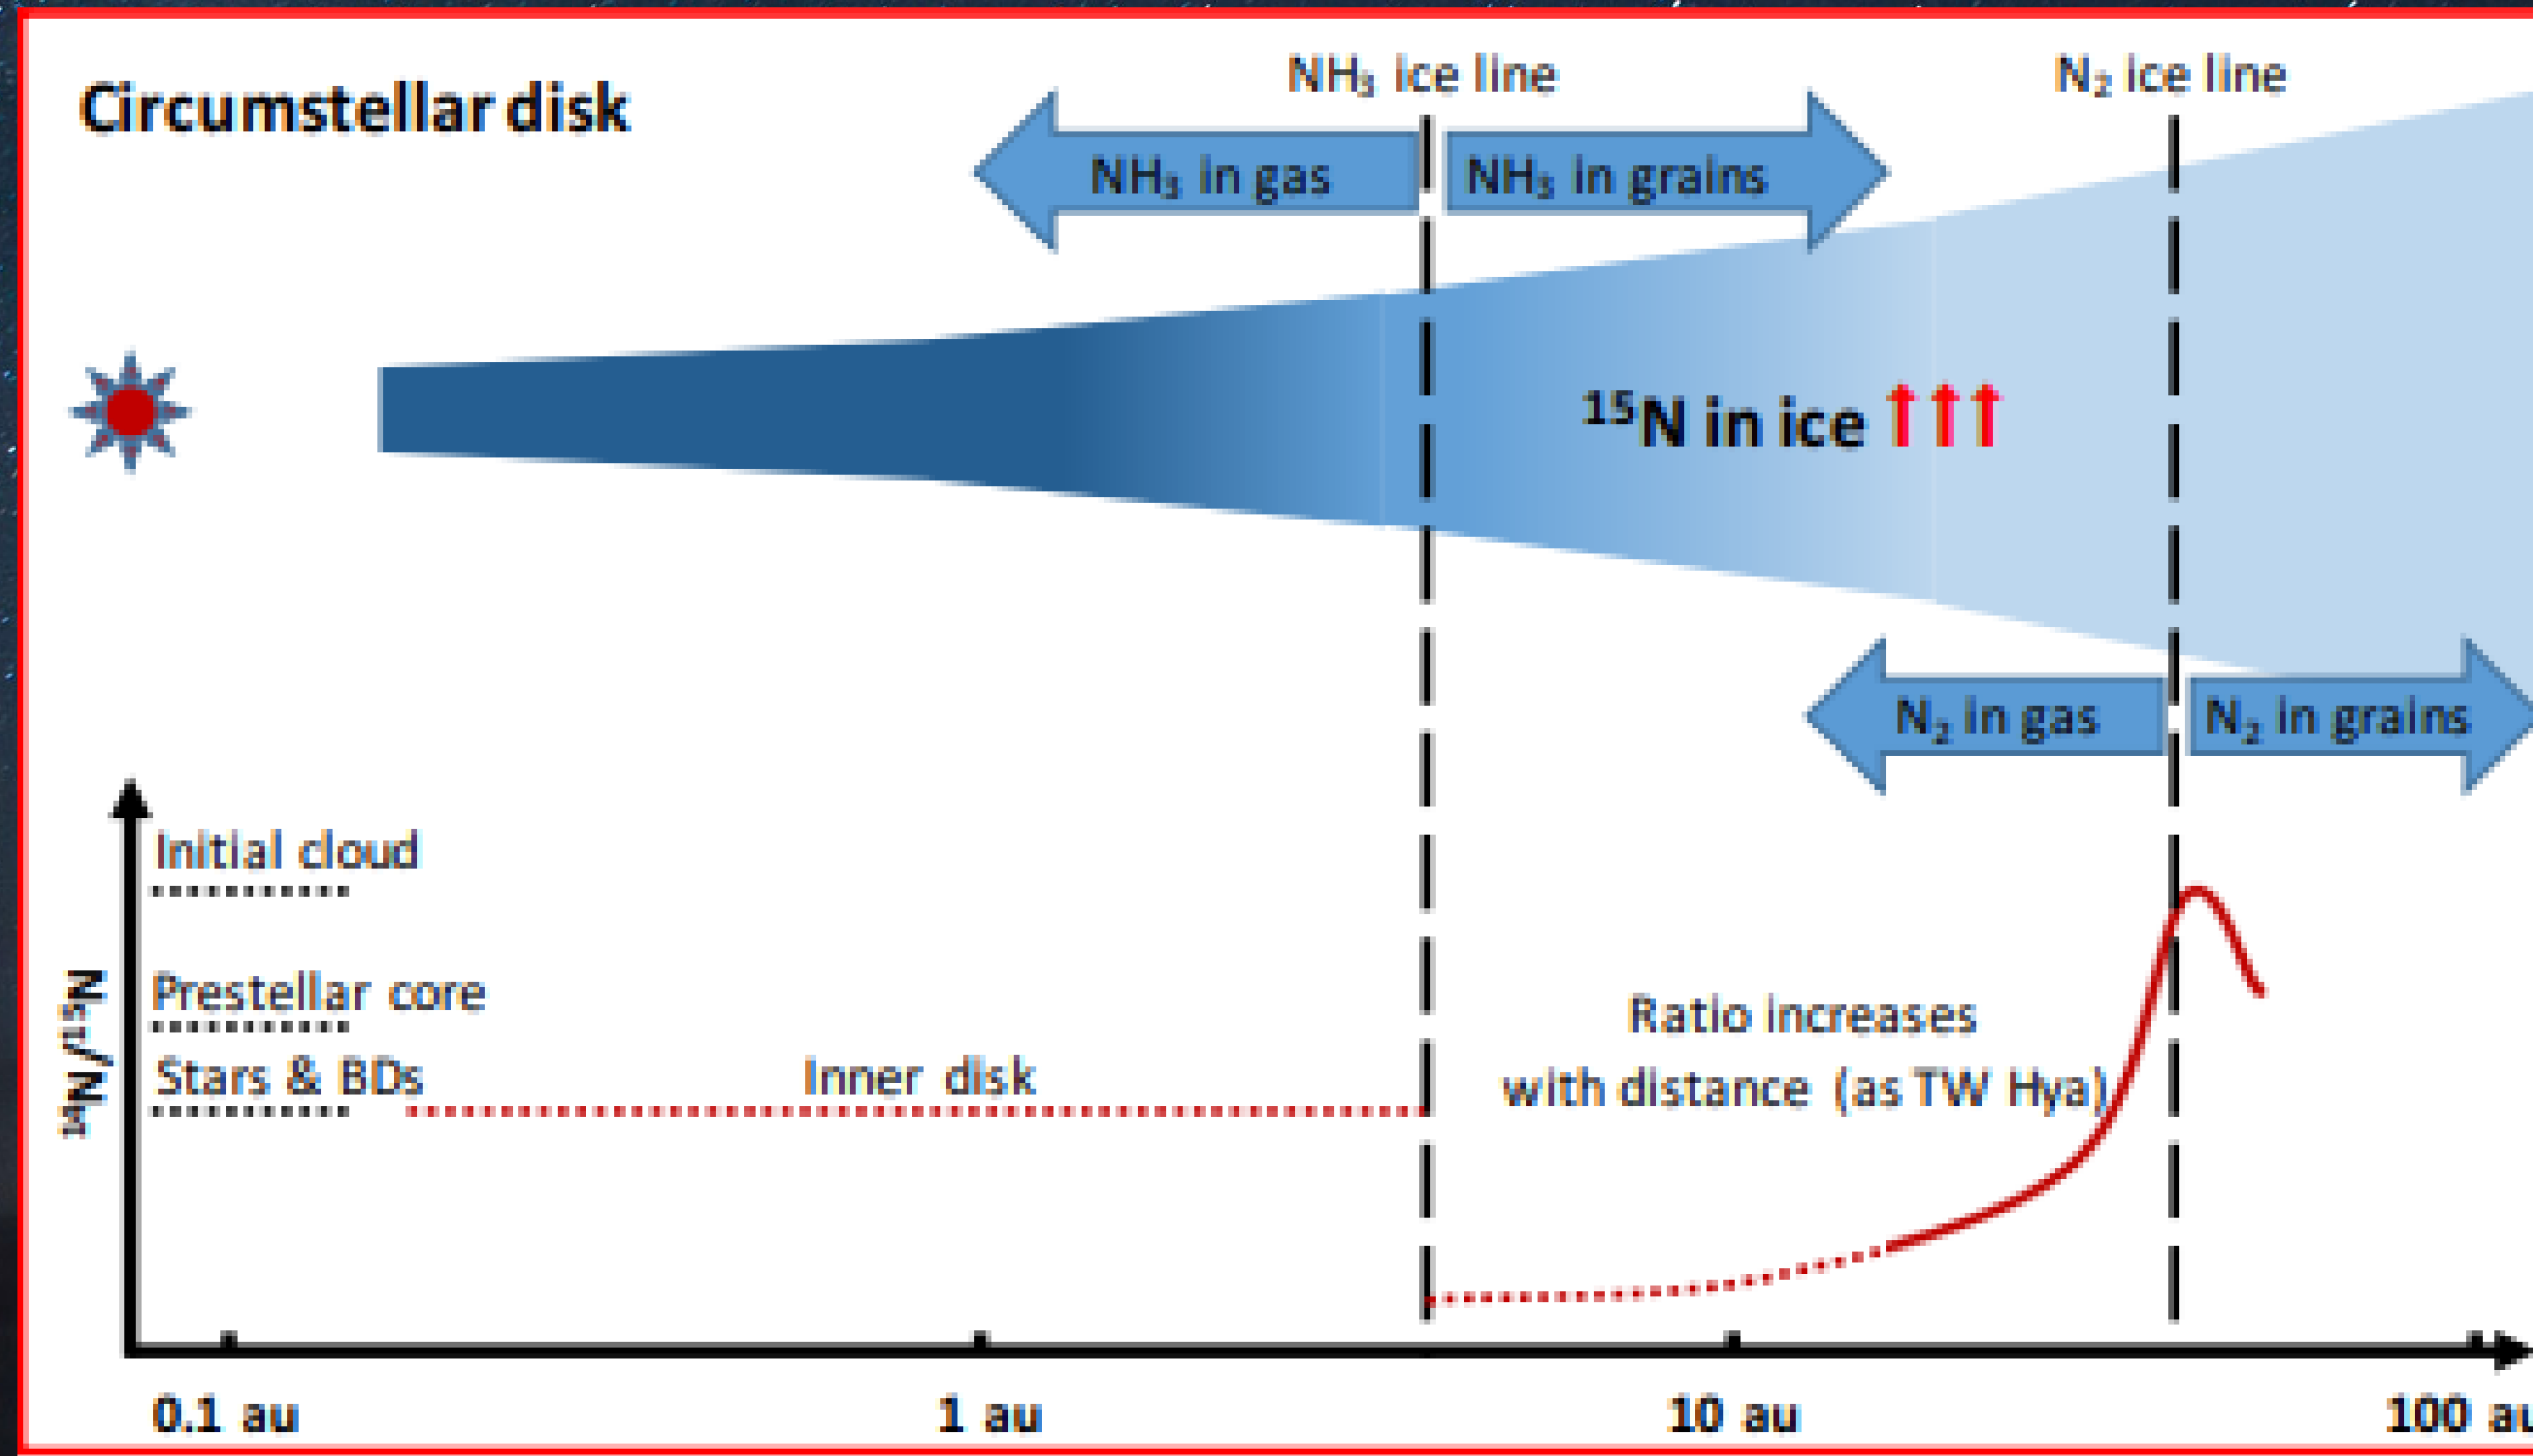

ISOTOPOLOGUE ABUNDANCE RATIOS

12C/13C Ratio: Fractionation near CO Snowline

Contamination by icy planetesimals rich in minor isotopes can lead to non-stellar isotope ratios in exoplanets

$^{14}\text{N}/^{15}\text{N}$ Fractionation

D. Barrado+ 2023

Enrichment from the minor isotope ^{15}N is expected in the mid-disk--closer to the ammonia snowline

$^{16}\text{O}/^{18}\text{O}$ Ratio: No fractionation throughout the solar system?

Allende Meteorite @ NMNH

Murchison Meteorite @ NMNH

No evidence for significant oxygen fractionation in chondritic meteorites: they have $^{16}\text{O}/^{18}\text{O}$ values ~solar [M&S 2019]

A night sky with the Milky Way galaxy visible over a mountain range. The sky is dark blue and black, filled with numerous stars and the bright, hazy band of the Milky Way. The mountains in the foreground are dark and silhouetted against the starry sky. The text "CARBON ISOTOPE RATIO MEASUREMENTS" is overlaid in the center in a white, sans-serif font.

CARBON ISOTOPE RATIO
MEASUREMENTS

TYC 8998-760-1: Two Young Super-Jupiters

-Powerful telescopes with high resolution spectrographs can detect MINOR isotopes!

-TYC 8998 b shows abnormal ^{13}C enrichment

-No host star measurement for comparison

TYC 8998 b $^{12}\text{C}/^{13}\text{C} = 31$
 \ll Solar ~ 90

WASP-77 A b

Line+ 2021

Gemini/IGRINS

R ~ 45,000

Near-Infrared

$12\text{C}/13\text{C} = 26.4 \pm 16.2$

$T_{\text{eq}} = 1650 \text{ K}$

Mass = $1.67 M_{\text{J}}$

Radius = $1.23 R_{\text{J}}$

Semi-Major Axis ~ 0.02 AU

Host Stars:

- Orbits the primary of a G/K dwarf binary

VHS 1256 b

Gandhi+ 2023

JWST/NIRSpec

R ~ 2,700

Mid-Infrared

$12\text{C}/13\text{C} = 62 \pm 2$

$T_{\text{eq}} = 1150 \text{ K}$

Mass = $12 M_{\text{J}}$

Radius = $1.3 R_{\text{J}}$

Semi-Major Axis ~ 350 AU

Host Stars:

- Orbits an M dwarf binary
- Very young system (Myr)

HD 189733 b

Finnerty+ 2024

KPIC/NIRSpec

R ~ 25,000

Near-Infrared

$12\text{C}/13\text{C} < 68$ (ISM)

$T_{\text{eq}} = 1200 \text{ K}$

Mass = $1.13 M_{\text{J}}$

Radius = $1.13 R_{\text{J}}$

Semi-Major Axis ~ 0.03 AU

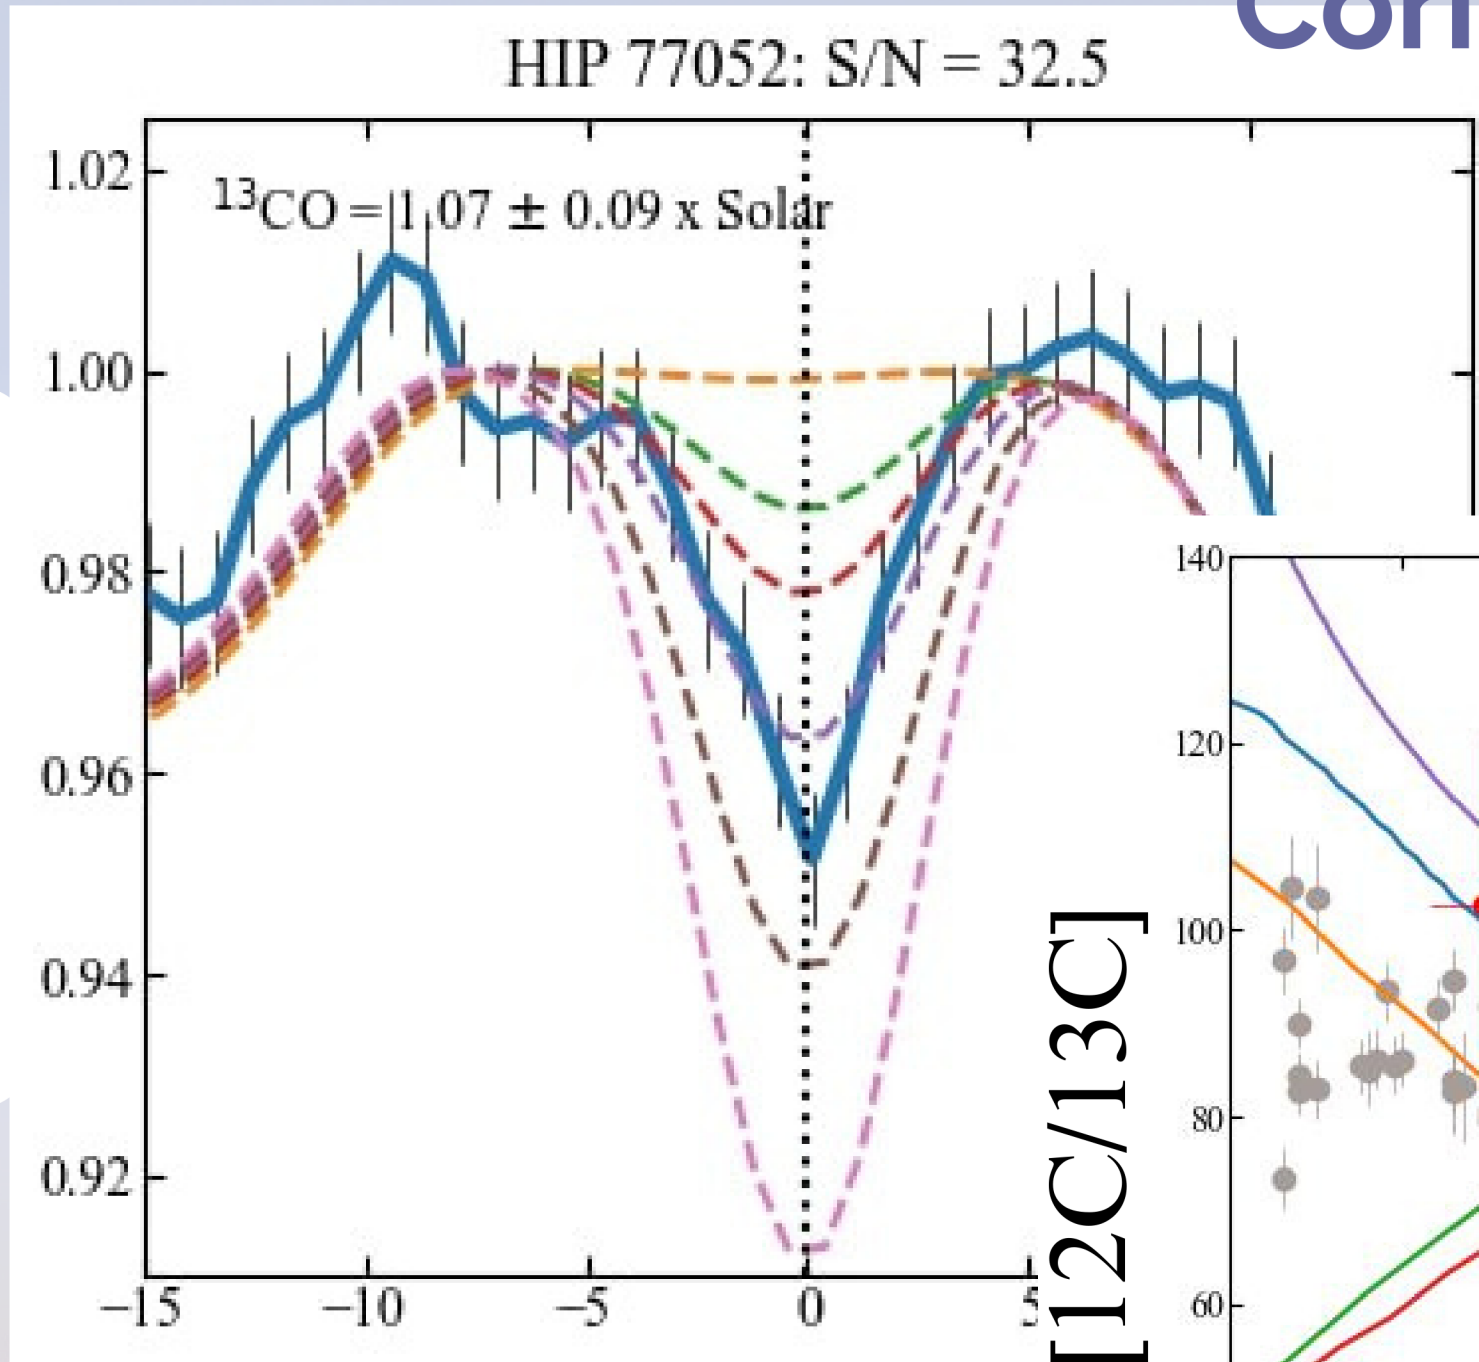

Host Stars:

- Orbits the primary of a K/M dwarf binary

12C/13C In Solar Twin Stars

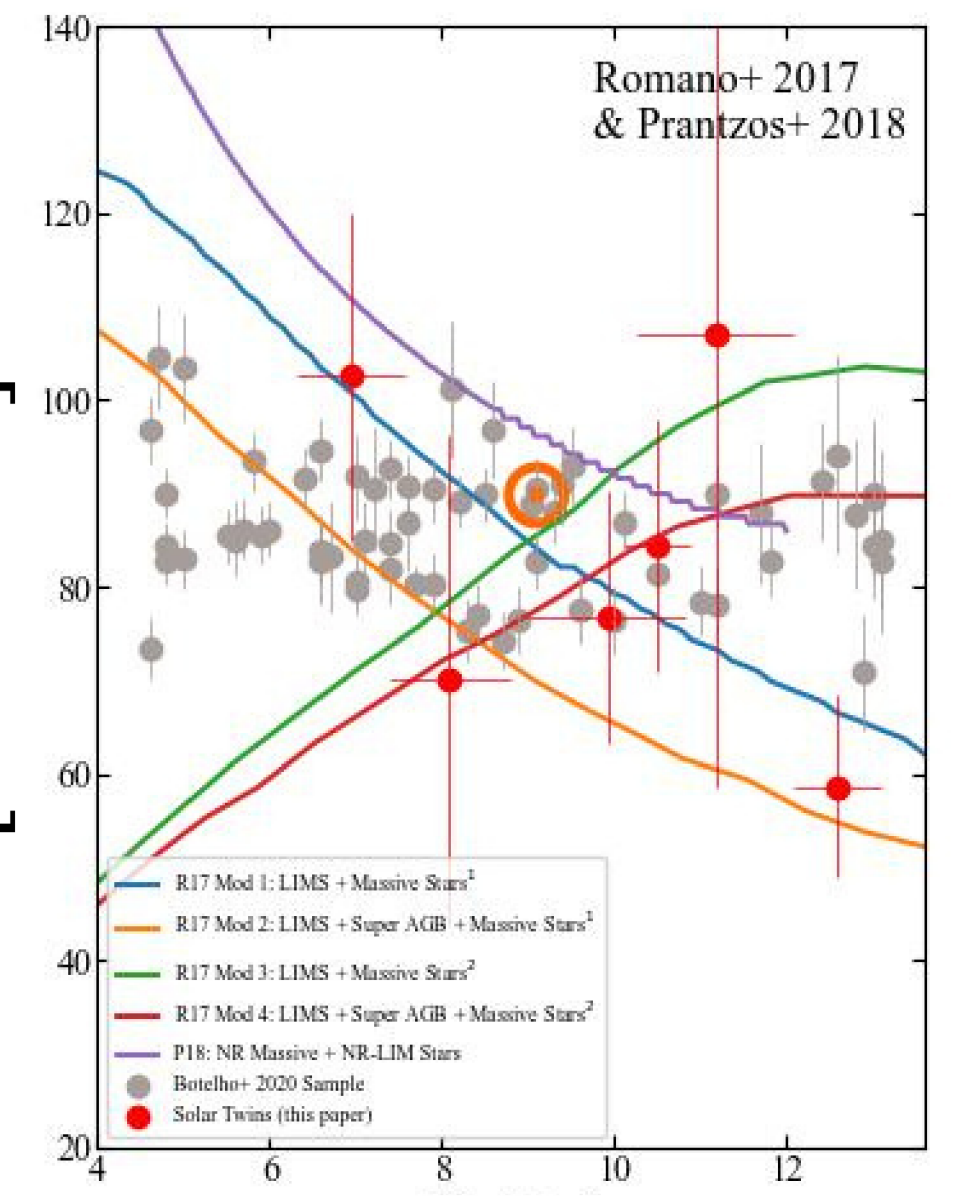

- ~70 Dwarf Star Measurements in the Literature; fewer exoplanet hosts
- We observe in the MIR because it gives us access to the CO rovibrational band @ 4.6-4.7 microns
- Lots of lines in this wavelength regime

Normalized Flux

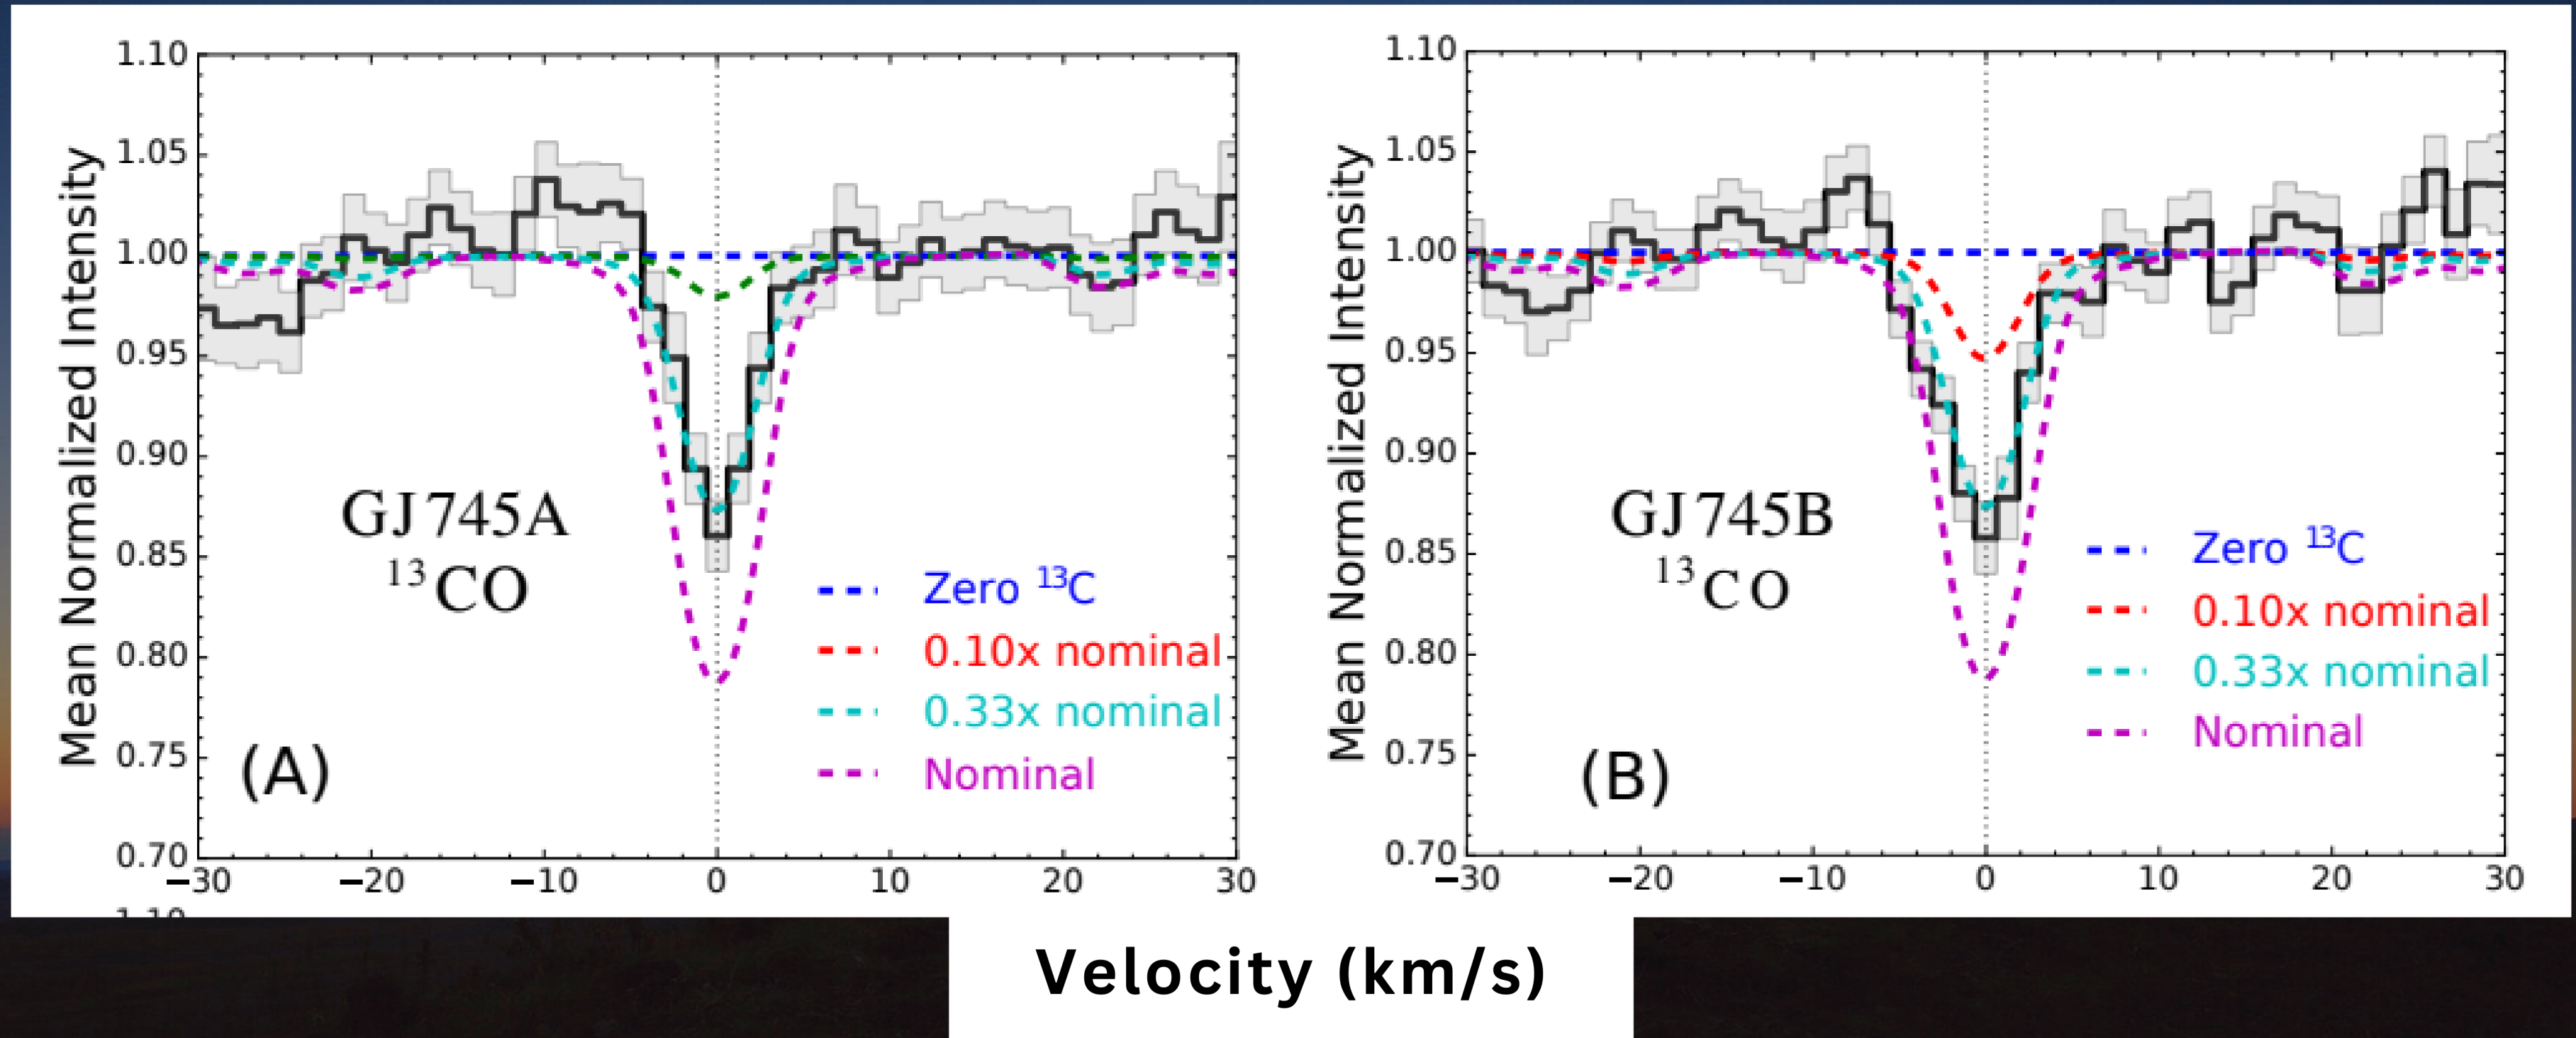

Velocity (km/s)

[12C/13C]

Time (Gyr)

Crossfield+ 2019: ^{13}C Detection in M Dwarf Stars

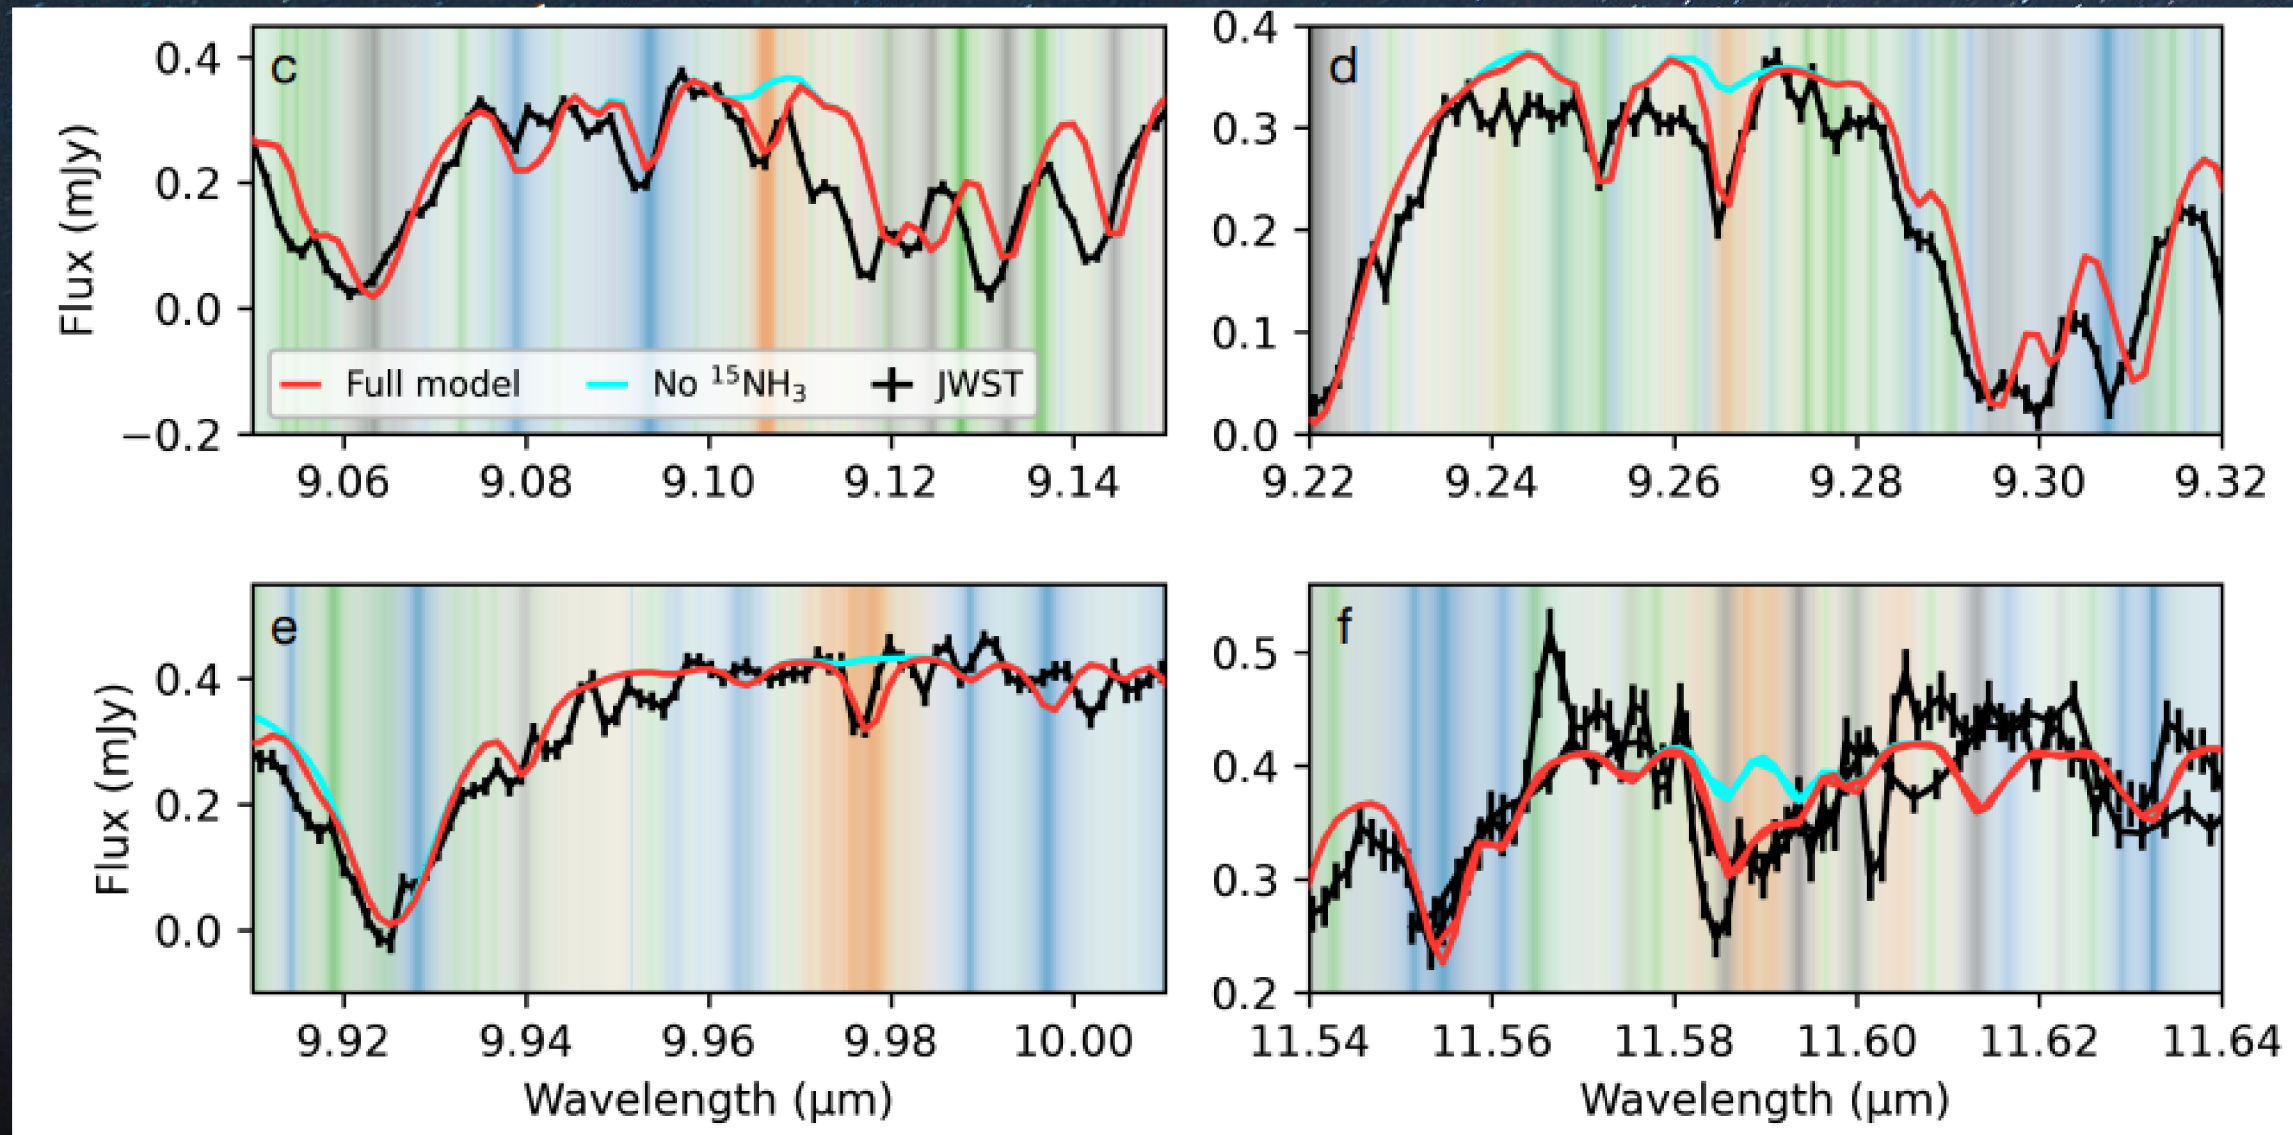

We can now make these measurements in the coolest, faintest stars!

A night sky with the Milky Way galaxy and a mountain range in the foreground. The Milky Way is visible as a bright, yellowish-white band of stars stretching across the sky. The foreground shows dark, rocky mountain peaks and ridges. The overall scene is a beautiful, dark landscape under a starry sky.

NITROGEN ISOTOPE RATIO MEASUREMENTS

WISE J1828: Nitrogen Isotope Detections in a Rogue Brown Dwarf

Barrado+ 2023

JWST is sensitive to ammonia isotopologues!
Ground-based observatories DO NOT have this wavelength coverage.

$^{14}\text{N}/^{15}\text{N}$ Ratio: No Measurements in Cool Dwarf Stars!

Sub-stellar nitrogen isotopes are typically detected using ammonia or other isotopologues not suited for stellar abundance determinations

Barrado+ 2023

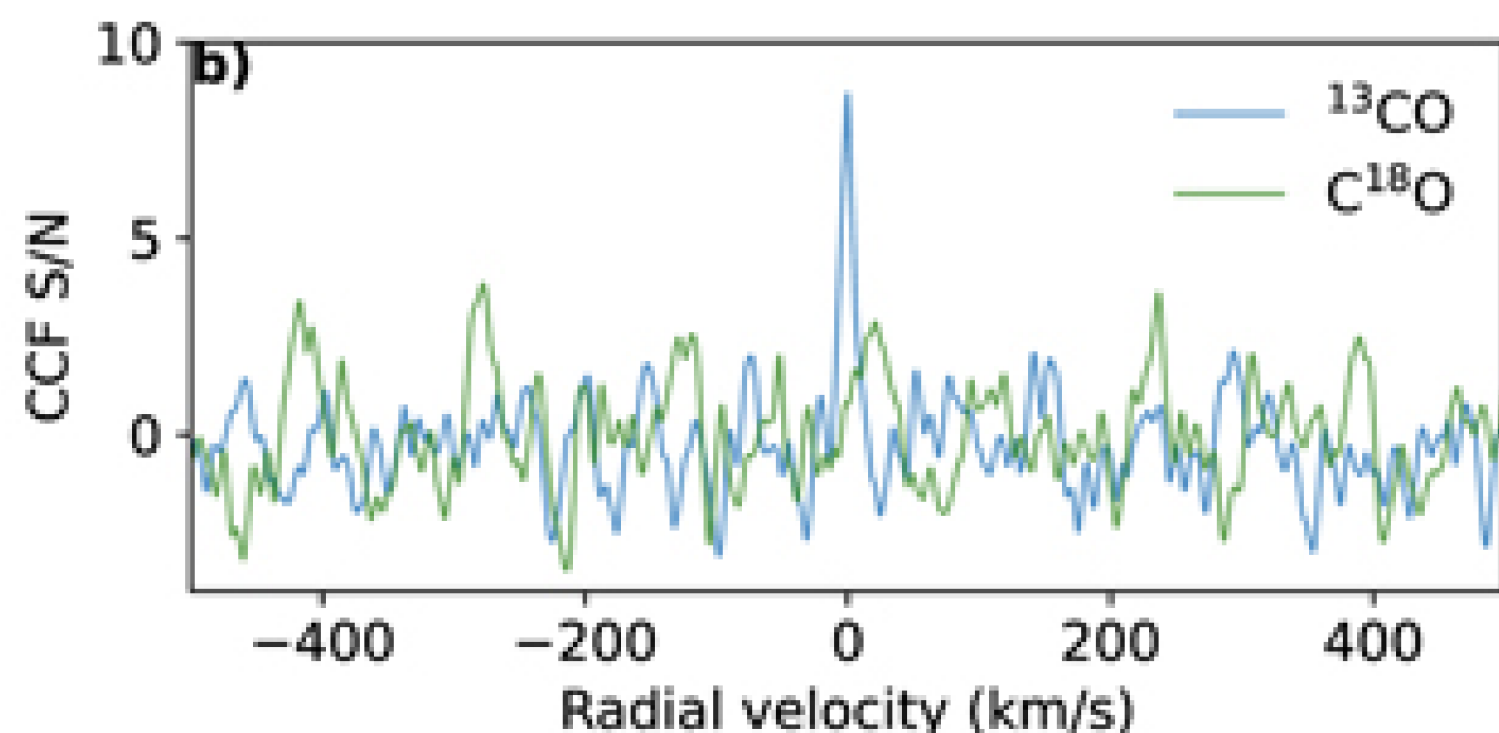

A night sky with the Milky Way galaxy and a mountain range in the foreground. The Milky Way is visible as a bright, yellowish-white band of stars stretching across the dark blue and purple sky. The foreground shows dark, silhouetted mountain peaks and ridges. The overall scene is a serene, natural landscape under a starry night sky.

OXYGEN ISOTOPE RATIO MEASUREMENTS

Brown Dwarf: 2M0355

Y. Zhang+ 2022

- 0.5 hr on VLT/CRIRES+
- Tentative super-solar constraint
 $16\text{O}/18\text{O} = 1489$ (err: +1027, -426)
- $S/N \lesssim 2$ due to sub-optimal observing conditions

Super-Jupiter: VHS 1256 b

Gandhi+ 2023

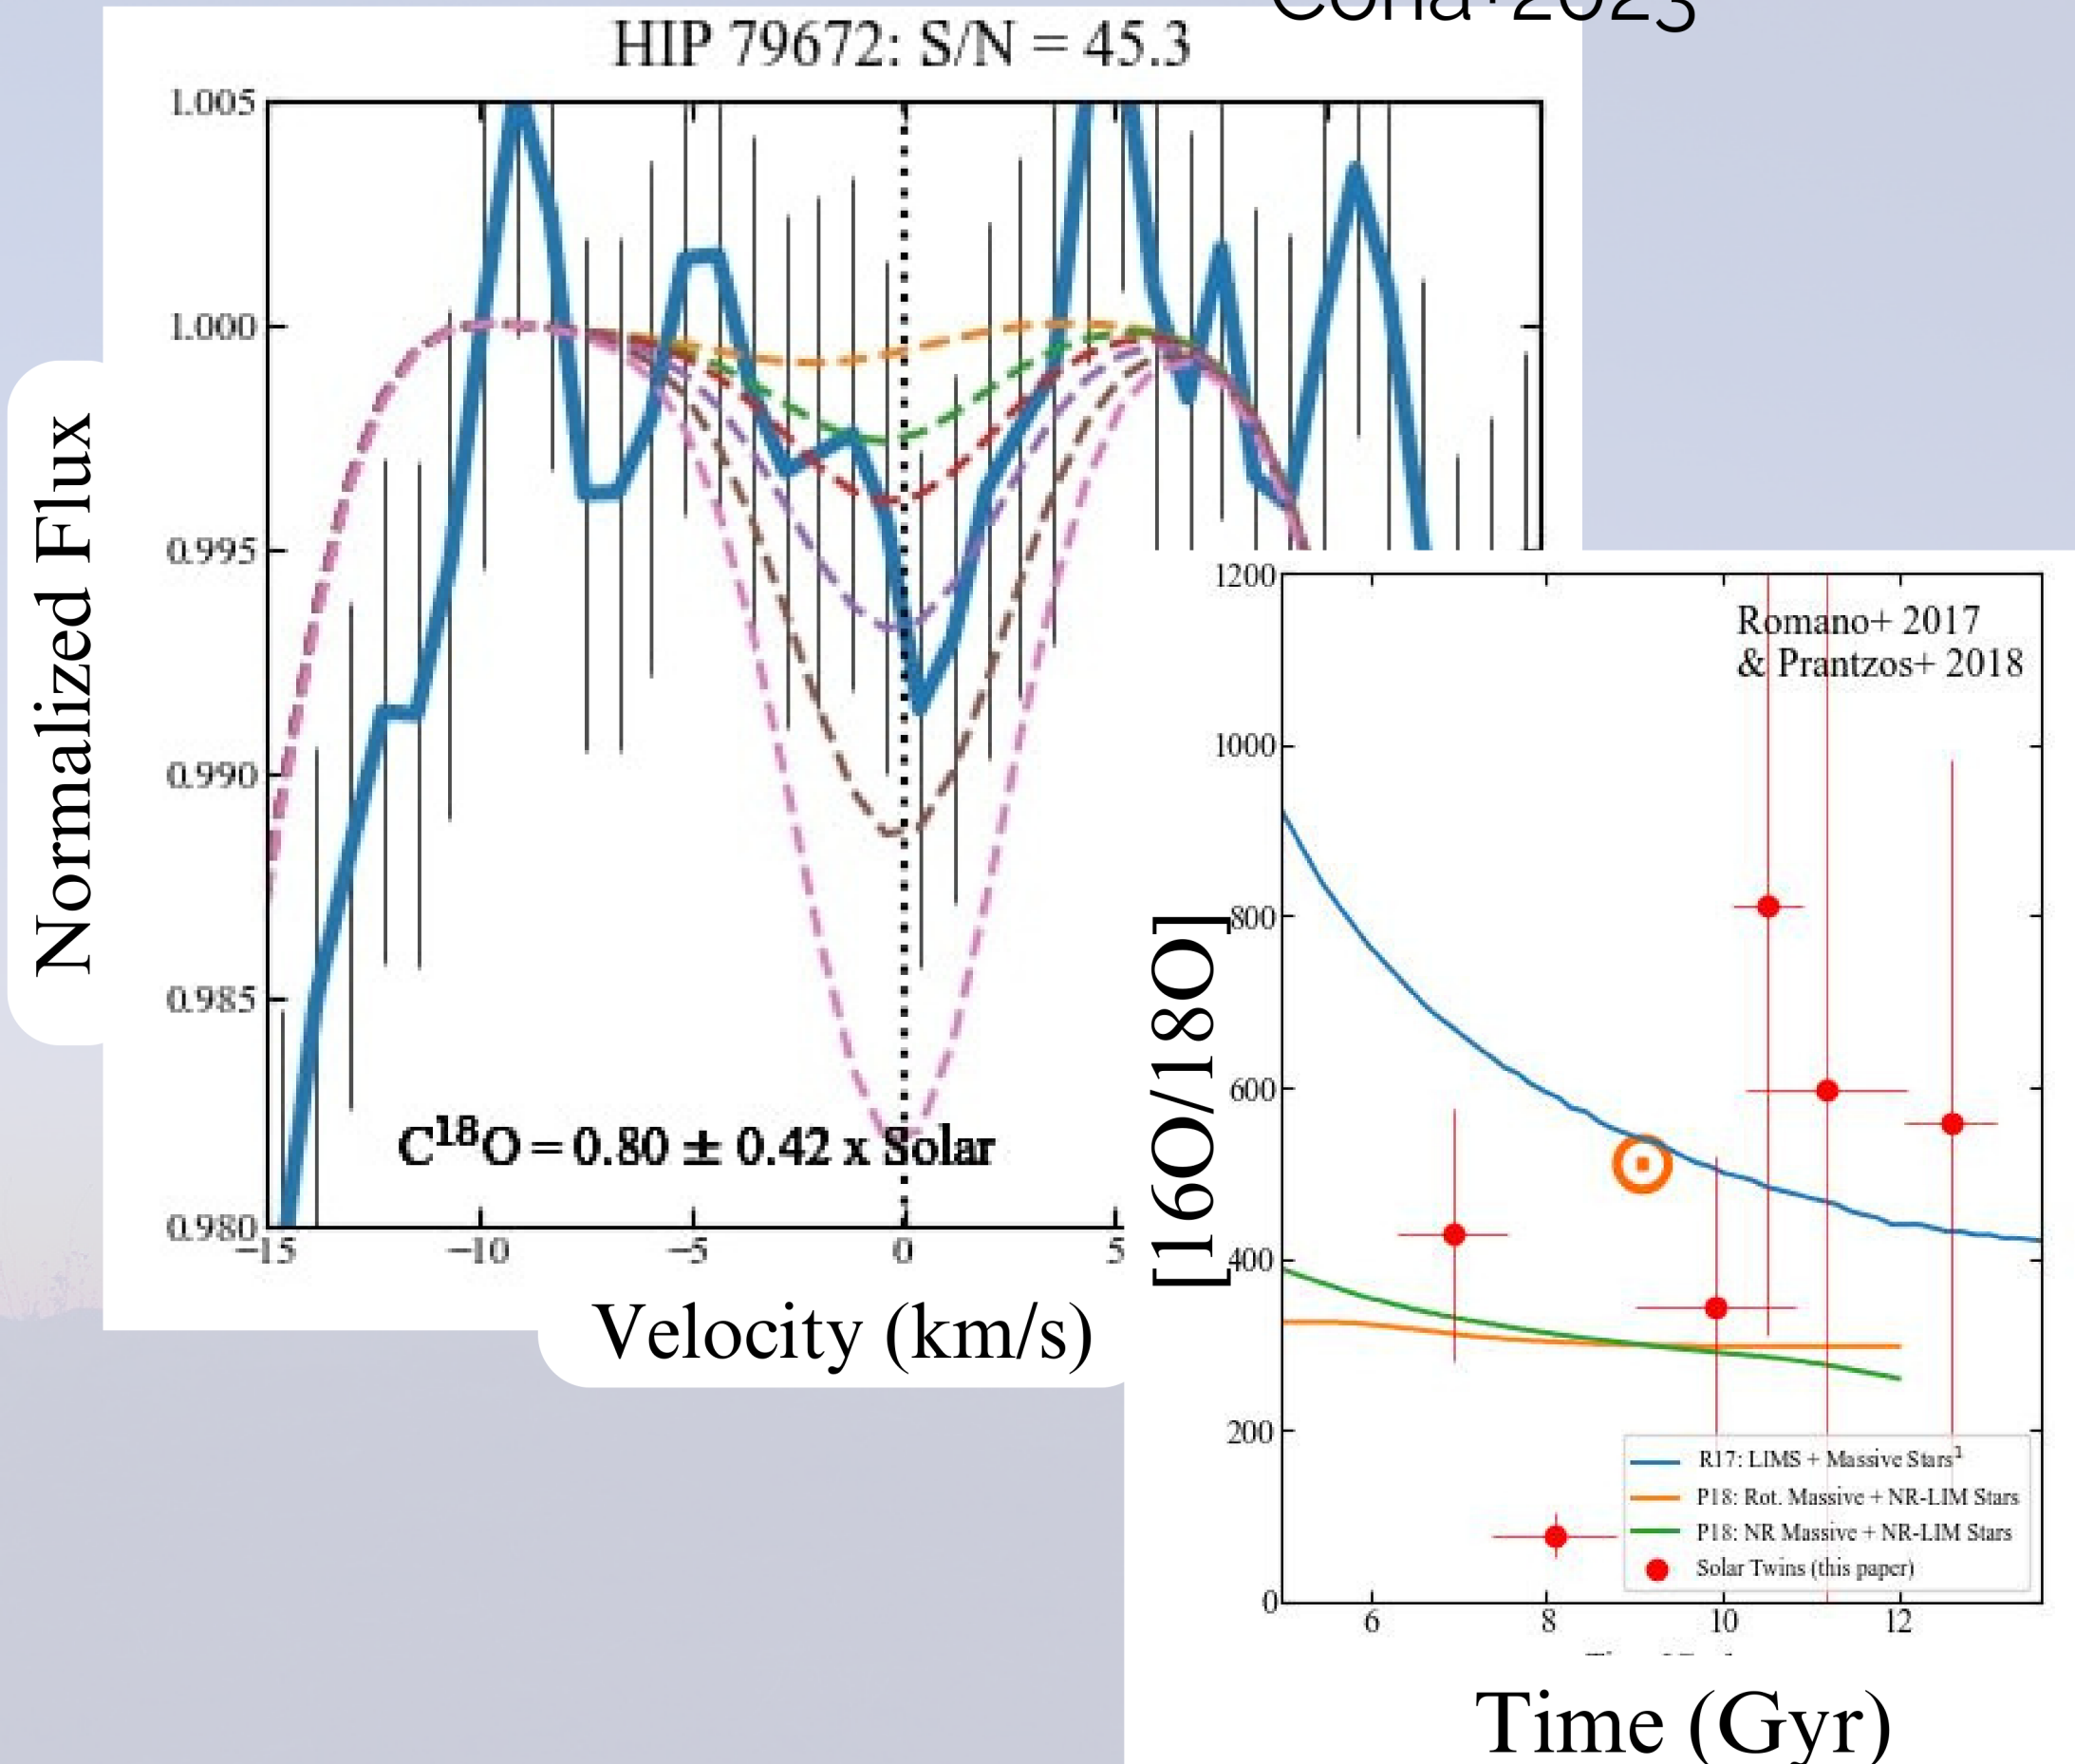

- JWST/NIRSpec @ 4.1-5.3 μm
- Precise sub-solar constraints
 $16\text{O}/18\text{O} = 425 \pm 30$
 $16\text{O}/17\text{O} = 1010 \pm 120$
- High S/N data ~ 10

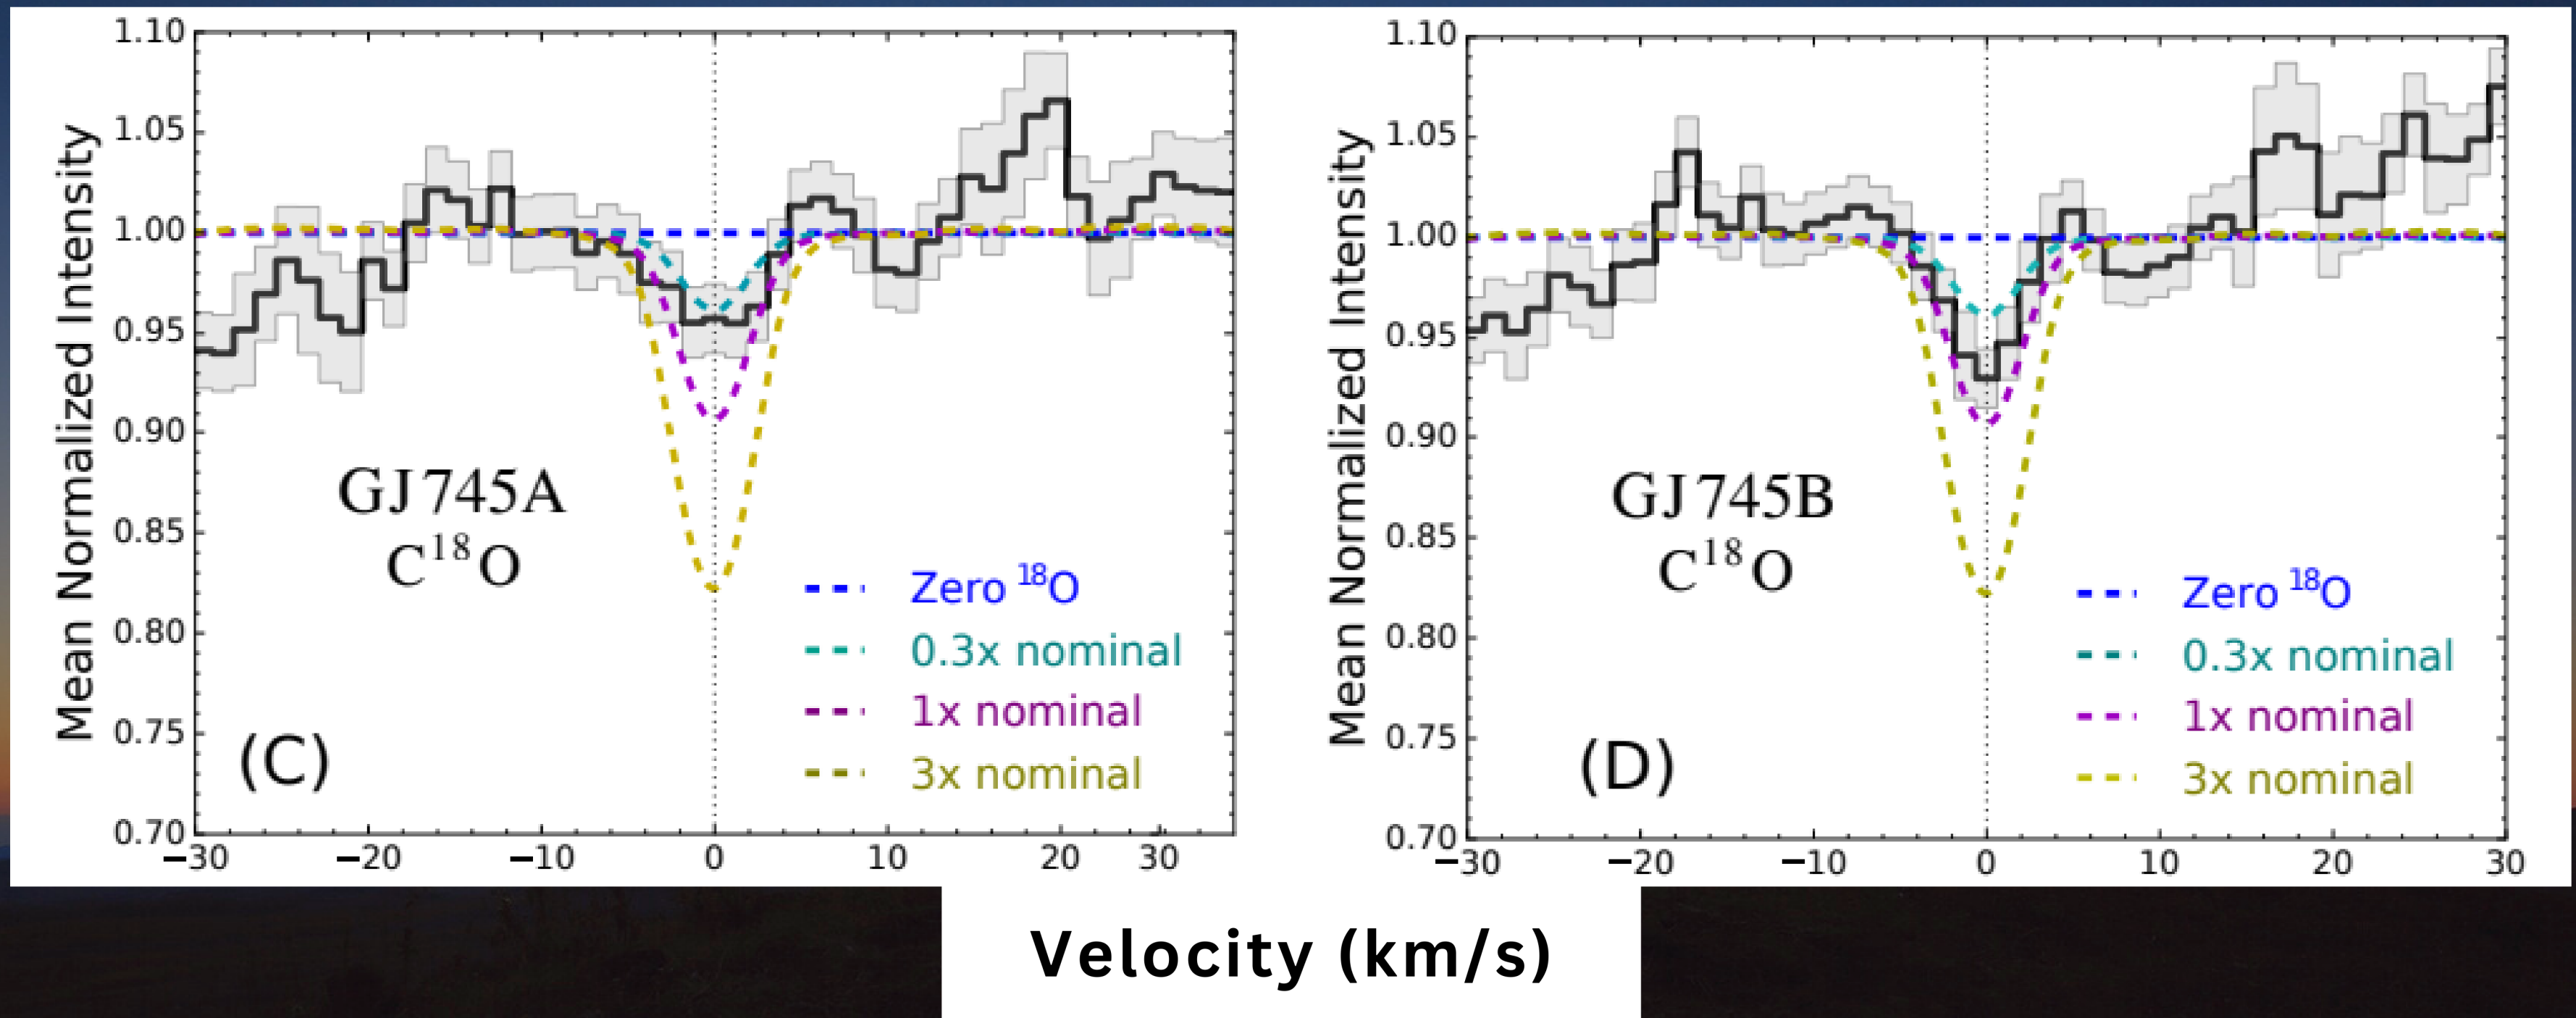

16O/18O In Cool Dwarf Stars

- ~Only ~8 Dwarf Star Measurements in the Literature; 1 exoplanet Host
- C18O is a minor isotopologue, less abundant than 13CO
- Lines are WEAK
- Analysis requires ~pristine~ spectra; large error bars even in these solar twin stars

Coria+2023

Crossfield+ 2019: ^{18}O Detection in M Dwarf Stars

We can now make these measurements in the coolest, faintest stars!

J. Xuan+ 2024: Carbon & Oxygen Isotope Ratios from Retrievals of NIR spectra

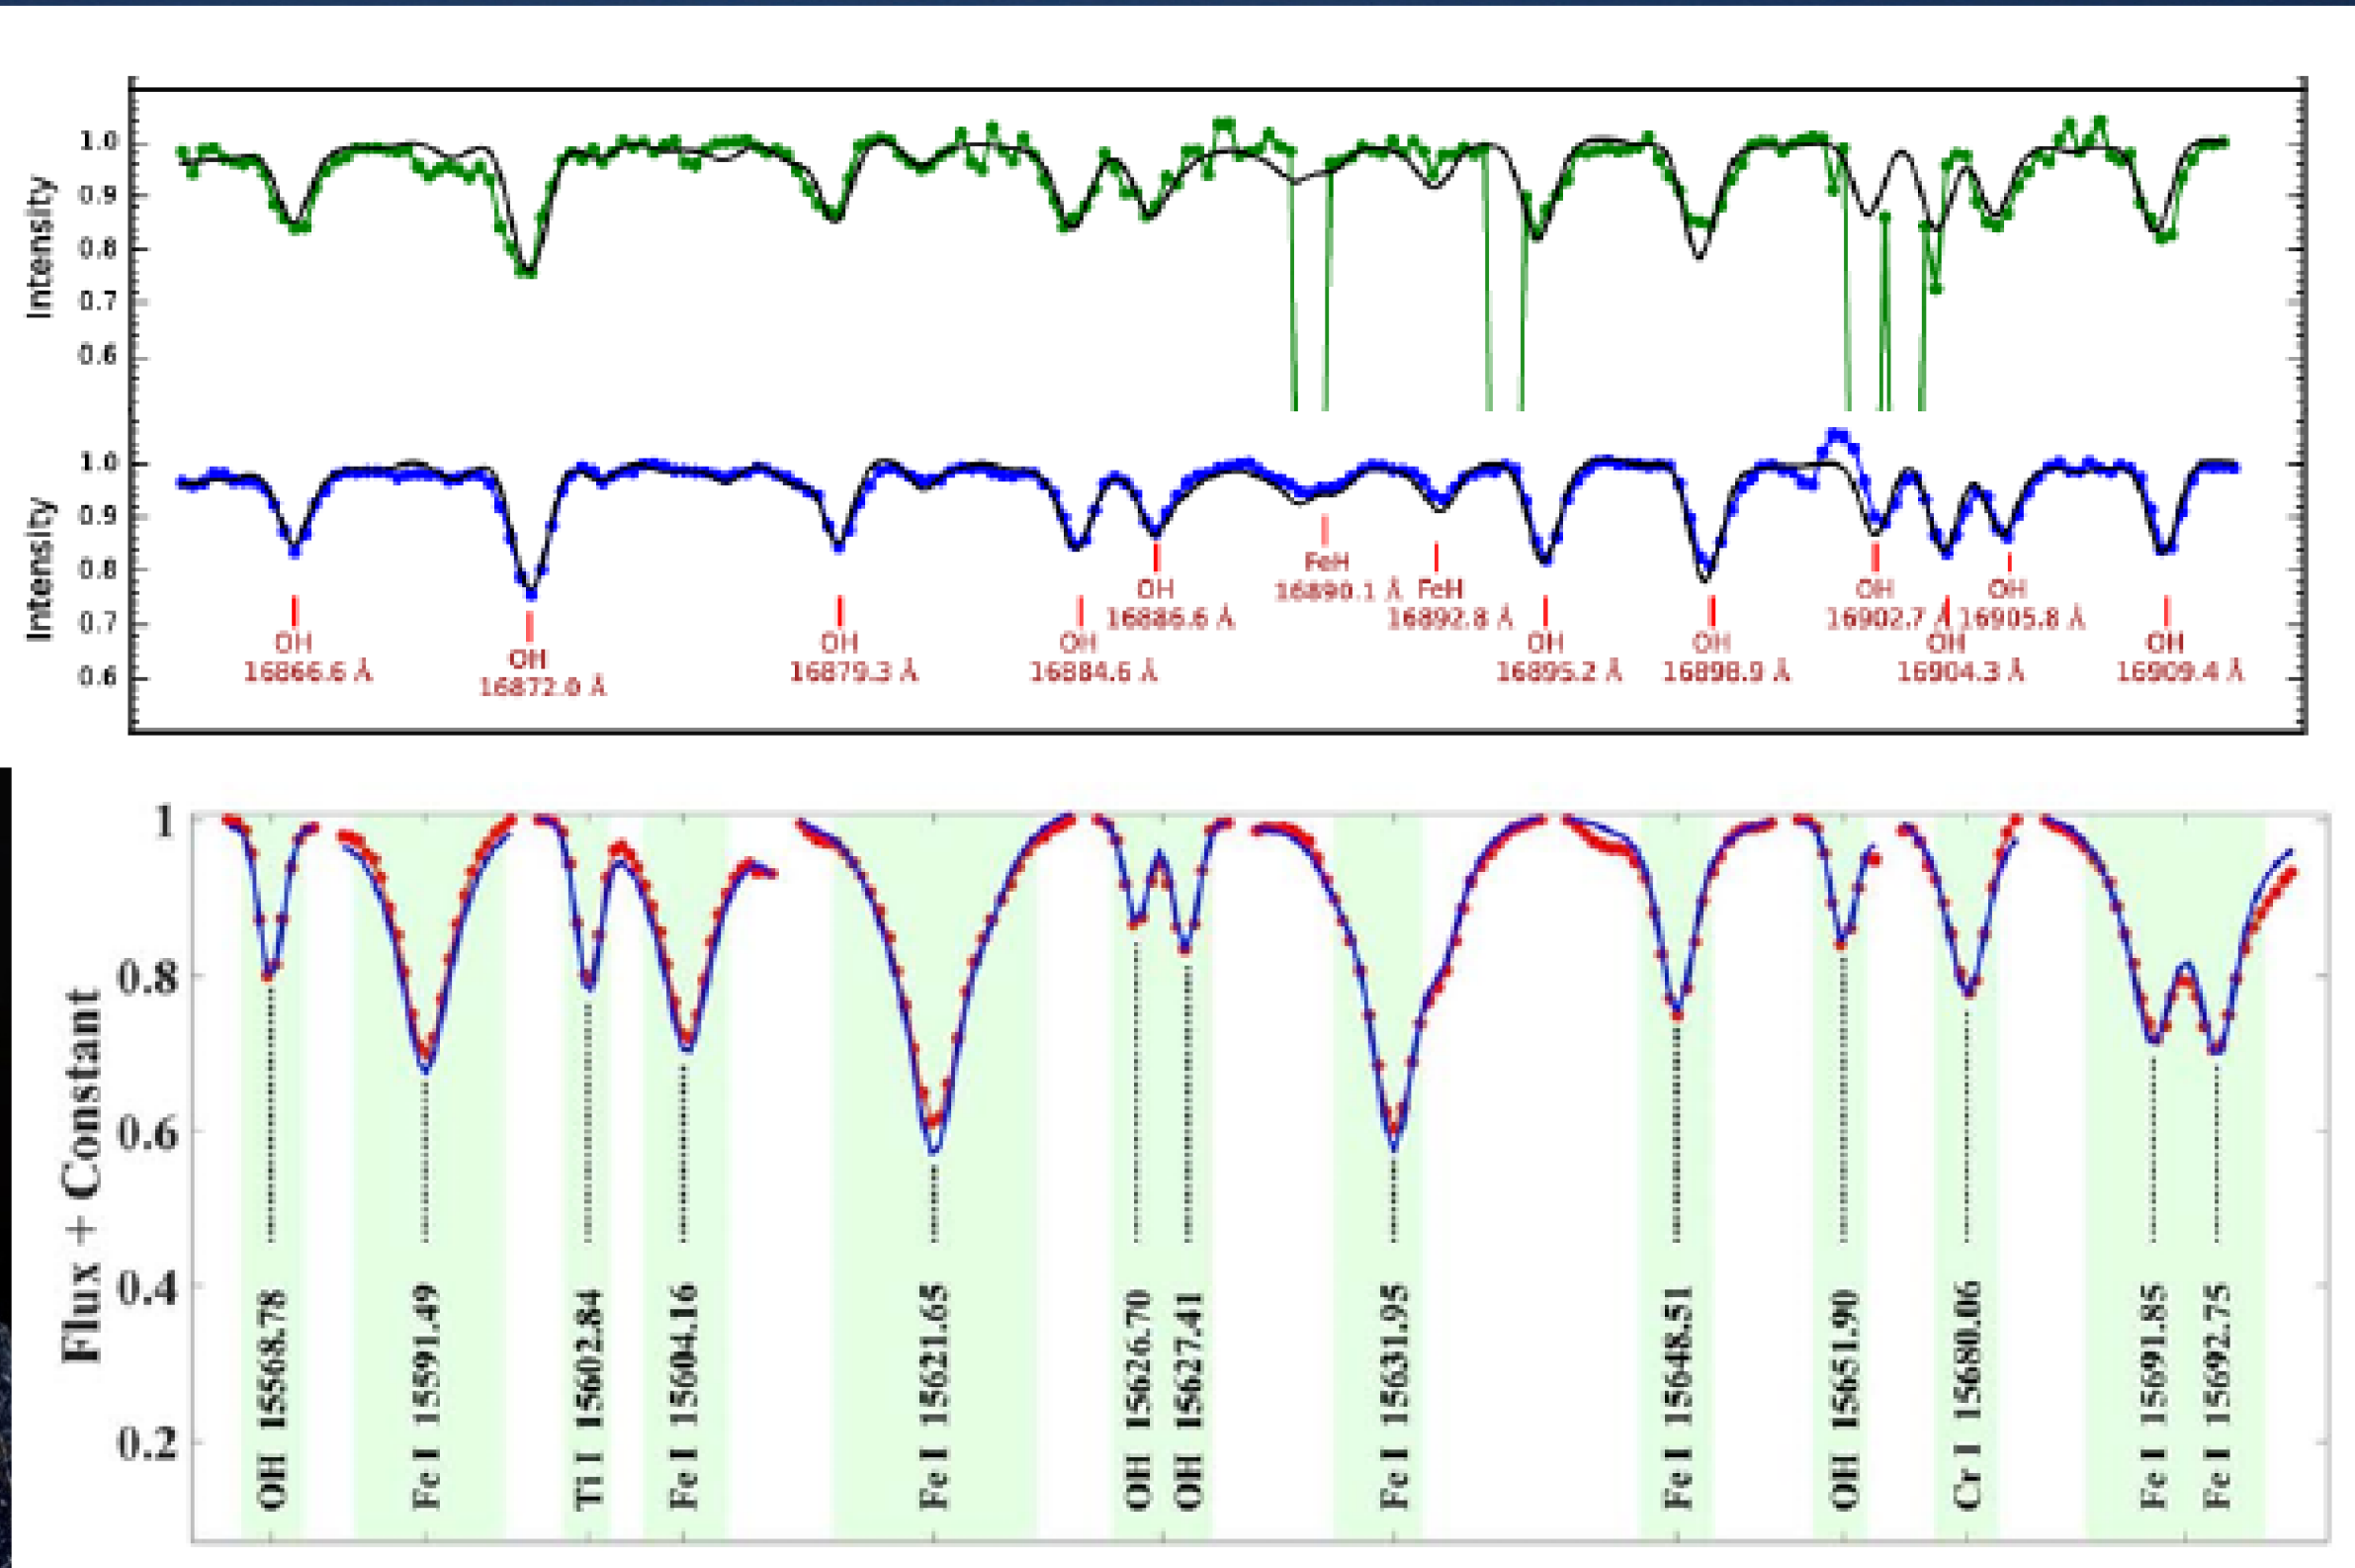

Both CO and H₂O isotopologues can be used to derive these ratios from cool dwarf, near-infrared spectra!

A night sky with the Milky Way galaxy and a mountain range in the foreground. The Milky Way is visible as a bright, yellowish-white band of stars and dust, stretching across the sky. The foreground shows dark, rocky mountain peaks and ridges, silhouetted against the starry sky. The overall color palette is dominated by deep blues, purples, and yellows from the stars and galaxy.

PROGRESS IN DWARF STAR ISOTOPE MEASUREMENTS

Modelling Stellar Spectra & Deriving Abundances

Souto+ 2017, 2018

Hejazi+ 2023

CNO Isotopes In Exoplanets & Hosts | 25

We have the tools necessary to accurately model cool dwarf spectra and measure their abundances precisely!

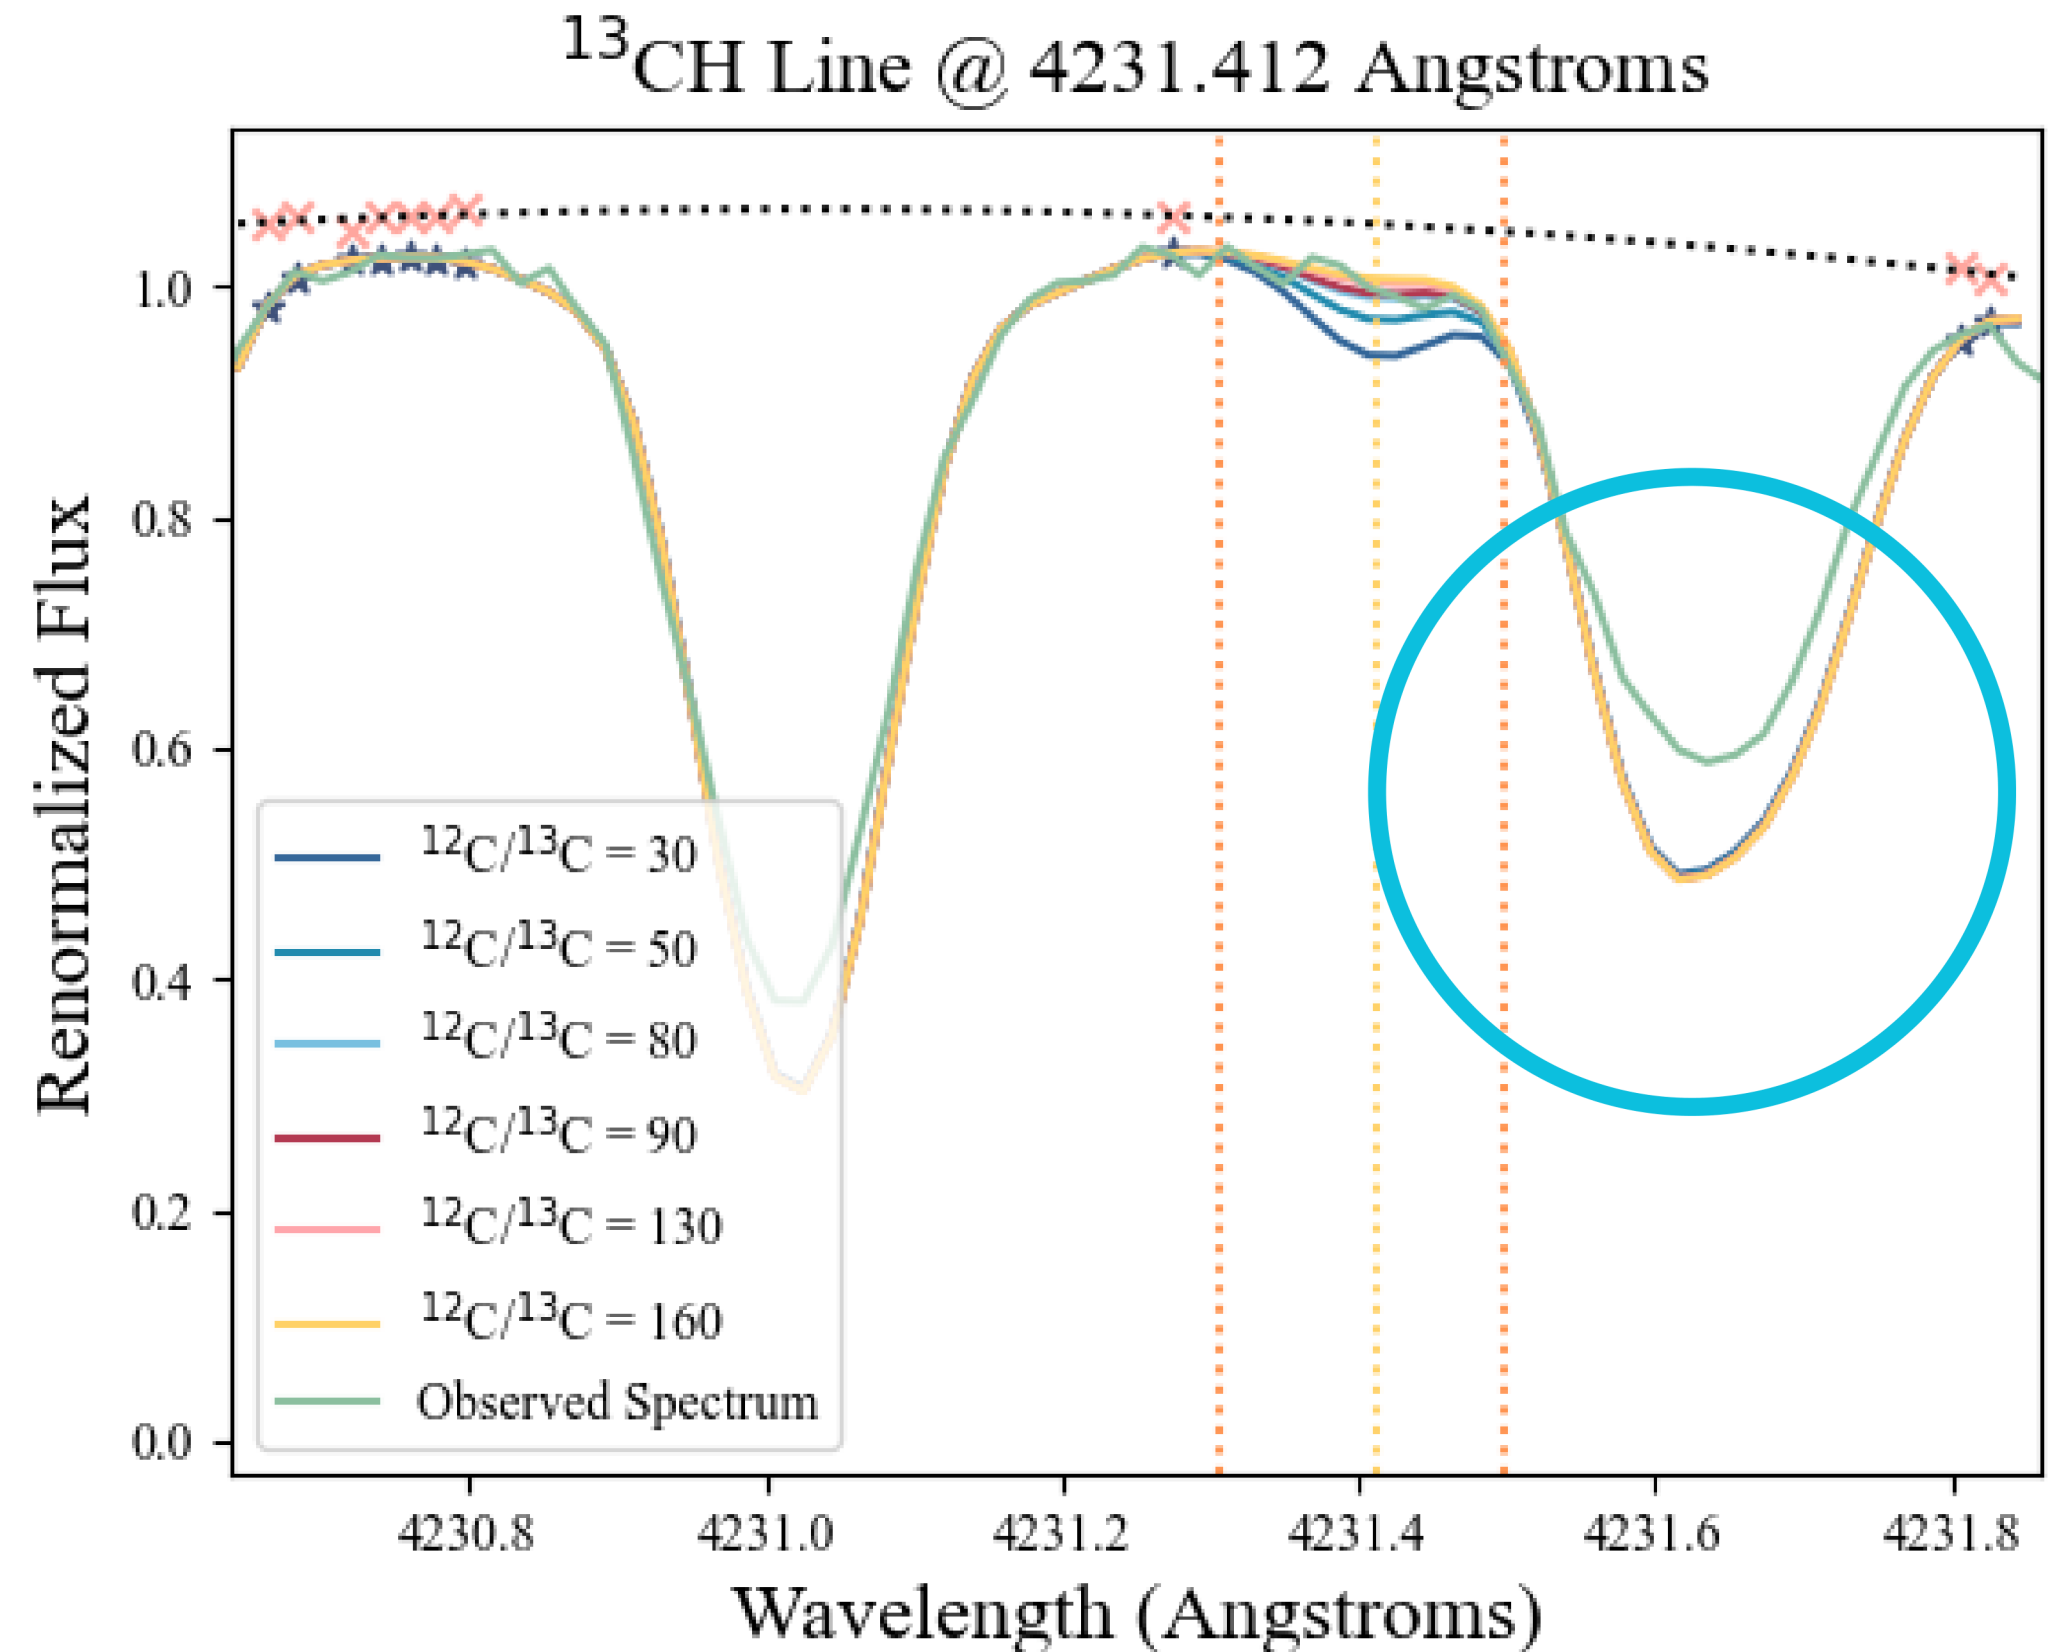

$^{12}\text{C}/^{13}\text{C}$ in WASP-77A: Keck/HIRES Spectrum

3600 - 4400 Angstroms

-Used MARCS/TurboSpectrum to generate a grid of model spectra with varying $^{12}\text{C}/^{13}\text{C}$

-Analysis requires careful continuum renormalization, and may need elemental abundance fit first

-Weak lines in the optical; CO lines in the NIR are preferable

$^{12}\text{C}/^{13}\text{C}$ in WASP-77A: Keck/HIRES Spectrum

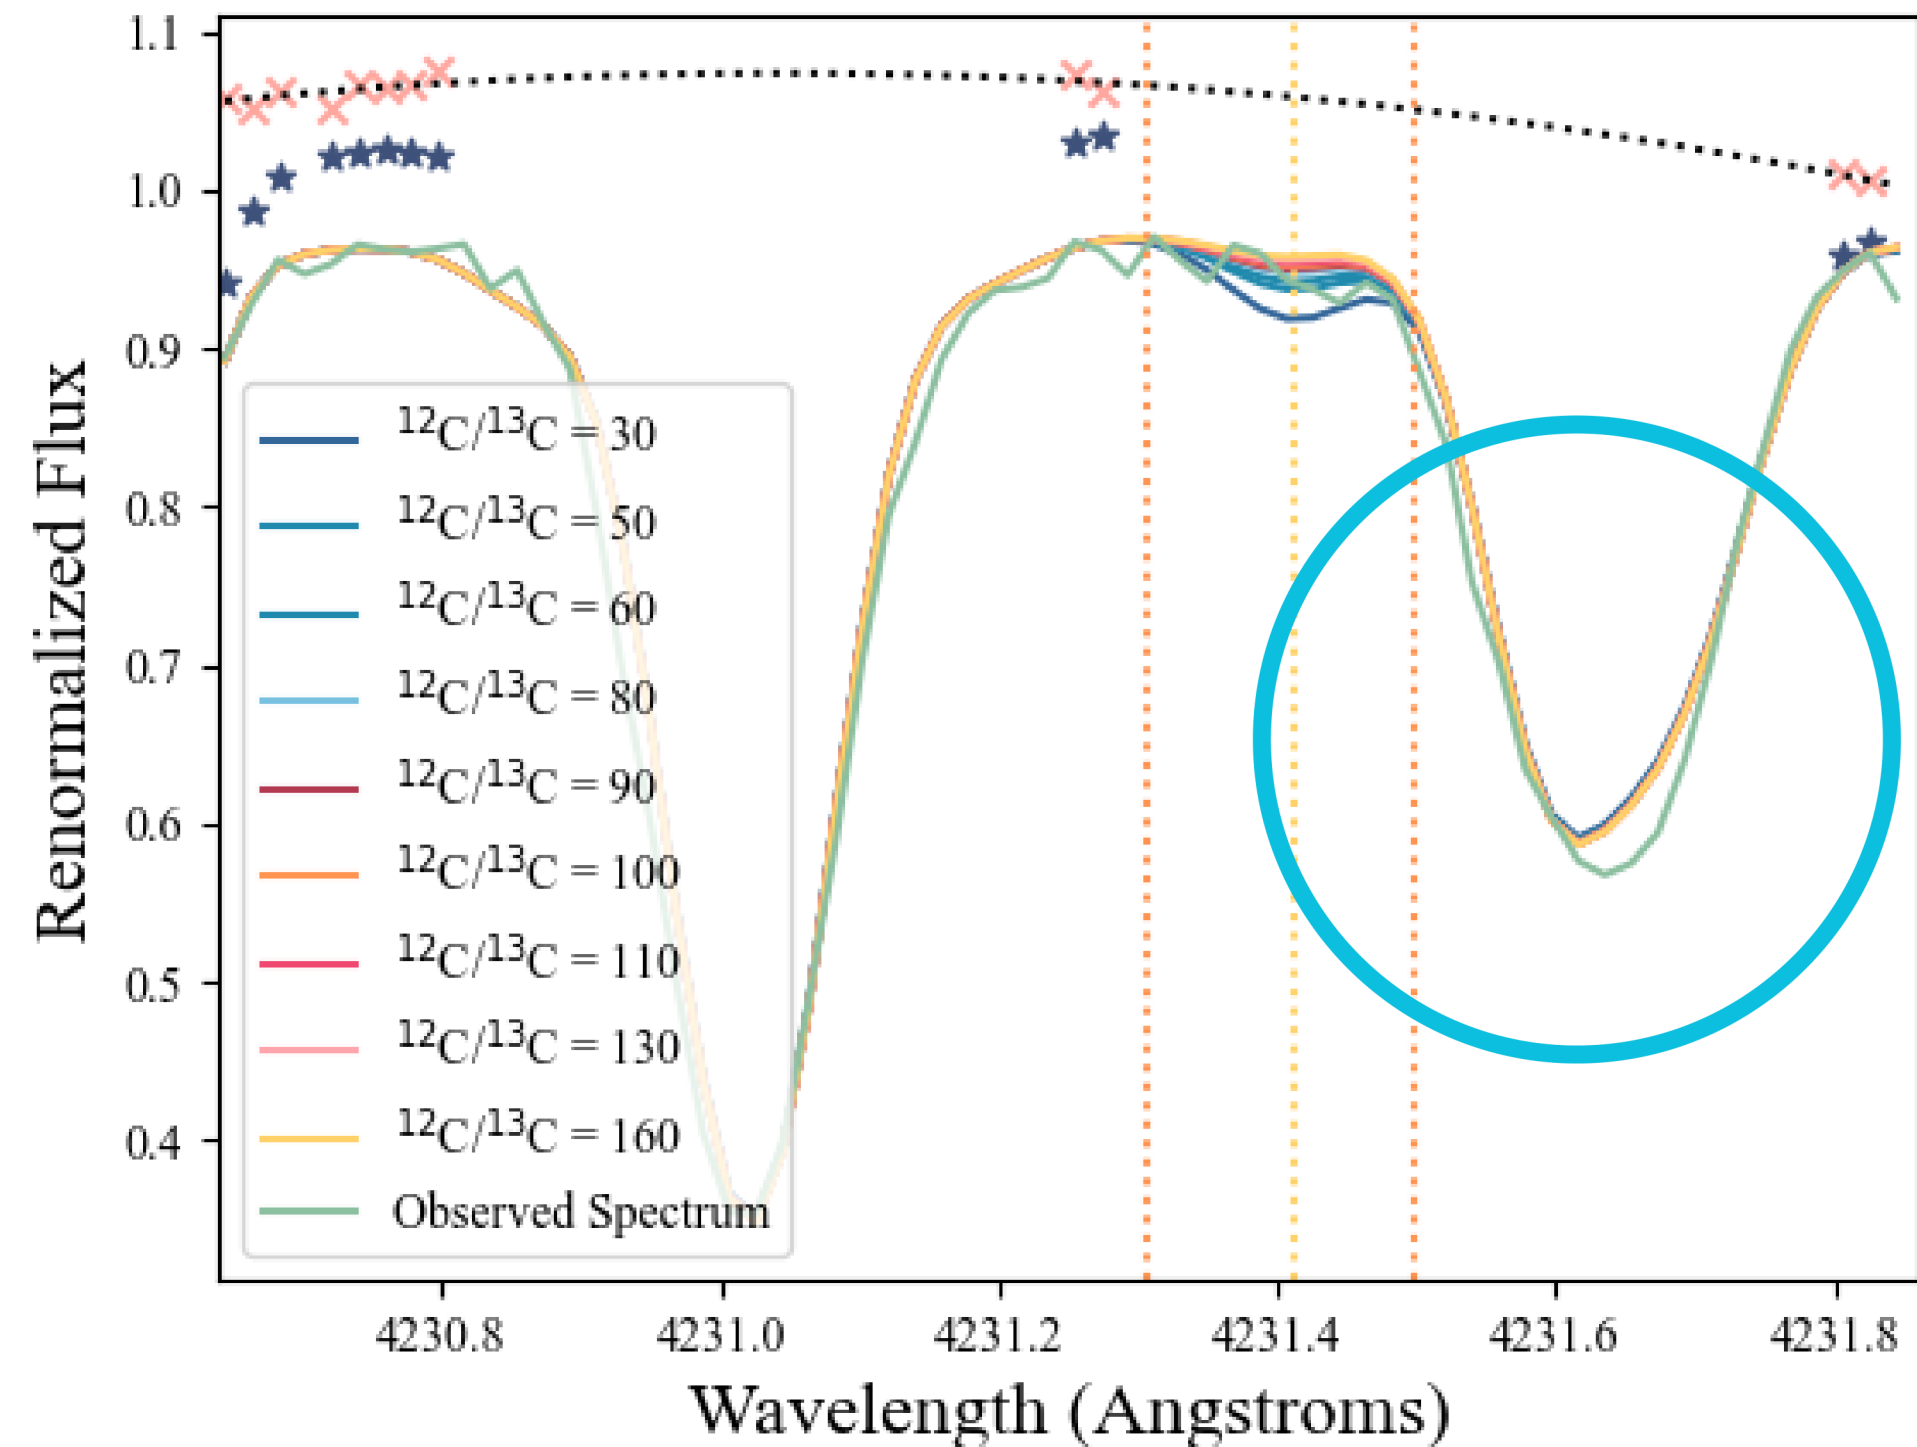

3600 - 4400 Angstroms

-Used MARCS/TurboSpectrum to generate a grid of model spectra with varying $^{12}\text{C}/^{13}\text{C}$

-Analysis requires careful continuum renormalization, and may need elemental abundance fit first

-Weak lines in the optical; CO lines in the NIR are preferable

^{13}CH Line @ 4231.412 Angstroms

Instrument	Reference	[Fe/H]	[C/H]	[O/H]	C/O
Keck/HIRES	Polanski+ 2022	0.01 ± 0.03	-0.02 ± 0.05	0.06 ± 0.07	0.46 ± 0.09
ARC/ARCES	Reggiani+ 2022	-0.05 ± 0.02	0.10 ± 0.09	0.23 ± 0.02	0.44 ± 0.07

**Hot Jupiter:
WASP-77Ab**

**12C/13C:
26.4 ± 16.2**

KEY TAKEAWAY

1) Embrace the Host Star!

Exoplanet atmosphere constraints are best interpreted in the context of their parent star.

NEXT STEPS

1) ID more “formation tracer abundances”

***Nitrogen and Sulfur may be useful!

2) Measure formation tracer abundances in stars hosting Jupiter-class planets where complementary measurements are possible
